My budget of motor papers this week has included quite a collection of hints about the petrol level in the jet of a spray chamber. One useful tip is a reminder that the petrol level cannot be accurately ascertained if the jet be a very fine one, such as employed on a 2 h.p. or 2¾ h.p. engine, for in such narrow orifices as these capillary action is set up, and a bead of spirit will tip the jet, even if the real level be half an inch down the thin tube. Another tip I do not remember to have seen in print before was originally imparted to me by a rider who used a 7 h.p. Peugeot engine geared very low on a belt-driven tricar. As originally adjusted, this engine ran very hot, probably owing to being over-driven. He finally cured the trouble by setting the level of spirit in the jet exceedingly low. His theory was that this adjustment reduced the consumption of petrol, and assisted the atomisation of the spirit by causing it to hit the spraying cone at a far higher velocity than was obtained with the usual level. The one drawback to the notion is that it is difficult to obtain a start with this adjustment, and frequently it was even necessary on the tricar in question to inject liquid petrol into the valve box. But with the engine once started, this adjustment probably gives a more homogeneous mixture, and hence cooler and more efficient running. In my own experiments, this particular adjustment seems to give improved results with the short inlet pipe favoured by certain makers, but to be of very little benefit when it is long.

A Quick Cure for Choked Jets.

I was riding a lightweight the other day, when bad running set in, followed by a total stoppage, all the symptoms pointing to choked jet. I was rather in a quandary, as I had practically no tools with me, and the jets of this particular carburetter are not specially accessible, and so remarkably small that no ordinary wire or reamer could enter them. It occurred to me that I might clear the jets by putting the machine on the stand, injecting a liberal dose of petrol into the cylinders, and starting the engine on this liquid petrol. I made one attempt in vain, as the engine had gummed during my thinking bout, but this preliminary essay freed the pistons, and on the second attempt the experi-

ment succeeded. The petrol injections provided sufficient explosive mixture for the engine to fire a few times, and just as it seemed inclined to die away the fierce suction cleared both jets, and in a minute I was taking the road again, without having dismounted my tiresome carburetter. The tip is worth applying to any engine when the jet is not accessible.

Fracture of Two-piece Valves.

I much regret to differ from Mr. G. Gray about the attachment of cast-iron heads to nickel steel stemmed exhaust valves. There is no guarantee that when a machine is out of order the valve will not be submitted to almost as great a heat as was originally employed to shrink an iron head on to a steel stem. Every fracture of a screwed head valve from which I have

E. Stubbs (3½ h.p. Rex) at the cross roads near the foot of Newnham Hill in the Coventry M.C. Climb. The spectators breasting the rise in the background give a good idea of the steepness of the gradient at this point.

suffered—and their name is legion—has occurred where the thread begins, at the point where the stem enters the head. This strain has been successfully resisted by a valve I had made with the stem bedded into the head for a little distance before the thread began. Two-piece valves ought to be made thicker in the shoulder than one-piece valves, and if this is done, and the stem countersunk into the head a little before the thread commences, the screwing method of attachment is perfect in practice.

A Good Tyre.

For winter riding I have always been a Palmer devotee, and think their ribs, with the deep channel between, the best anti-grease device I have yet struck. I am now using a pair of 2¼ in. Palmer Cord tyres on 2 in. rims on quite a heavy machine, and they seem to have solved my tyre problems. The Palmer has a very thick tread, very stiff side walls, and is almost skid-proof. I believe it would be far more widely fitted were it not for an ancient fable that it just nicks into a tramline. To get any tyre of less than 2½ in. section in dead register with a tramline usually spells a fall, and no motor cyclist worthy of the name would commit such a blunder. I consider my present pair of tyres quite equal to anything I have tried in their standing up qualities.

QUESTIONS & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and, whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Touring Abroad.

Can you give me some advice as to taking a motor cycle abroad? I mislaid the Motor Union circular which appeared in a recent number of *The Motor Cycle*, and not knowing the secretary's address have not been able to learn anything from that quarter.—O.C., Chiswick.

The address of the secretary of the Motor Union is 1, Albemarle Street. There is also the Auto Cycle Union—secretary's address, 18, Down Street, Piccadilly, W. Either of these societies will provide you with a pass on coming a member. The pass will take your machine through the customs, and you will only have to pay a *permis de circulation*, price 6d.

Preparing for a Tour Abroad.

My machine is a 1908 Triumph. (1.) Would it be difficult or unnecessary to fit a secondary-ignition of coil and battery to ensure absolute reliability? (2.) Could the present magneto contact make and break be employed by somehow cutting out the magneto in the change? (3.) Can you offer a simpler solution than the above of my machine not starting unless I run it along at a great pace? (beyond dirt in carburetter and choked feed pipe). (4.) How often on my machine would you say I should clean and examine, and how often replace platinum points? (in mileage). (5.) How often (roughly in mileage) grind valves, and how often clean off carbon on top of piston? (6.) How long are piston rings supposed to last, and do you consider it necessary to carry one as spare when machine is touring abroad?—C.F.N.

It would be most difficult and quite unnecessary to fit supplementary ignition to your bicycle. (2.) Not without altering the magneto considerably. (3.) First of all, see that the magneto points are clean and separating about 1 mm., that the sparking plug is a good one, and that the points are not more than .4 mm. apart, and then see that the air is almost entirely shut off when attempting to start, especially in bad weather. Half the trouble in starting is due to too much air when the engine is first started over compression. Always flood the carburetter

before attempting to start. (4.) The platinum points will probably last out the machine if you are careful to see that the condenser connections are clean and give a firm contact between the steel spring and brass cover and the screws holding on the said spring. (5.) About every 1,200 miles. (6.) It is impossible to say. If of the right material they last for thousands of miles. It would be rather a good plan to carry one when touring abroad, as spares are difficult to obtain.

Motor Cycling for Health.

My non-motoring friends tell me that motor cycling is bad physically, and that no one pursues that pastime for any length of time. What can you say about that?—M.H., Edinburgh.

Persons who have not tried motor cycling cannot tell whether it is bad physically or otherwise, therefore they are not in a position to judge. The best answer we can give you to this query is to refer you to a series of articles published in *The Motor Cycle* entitled

F. Toman (2½ h.p. Laurin and Klement) leading in Heat I. of the Tourist Handicap at the A.C.U. Race Meeting at the Stadium on the 22nd ult.

"Motor Cycling for Health," being the opinions of medical men who are actual users of motor cycles. The first of these articles was published on May 6th, and we are sending you a copy of the paper for that date. If you can succeed in converting any of your non-motoring friends sufficiently to induce them to read this article we should be obliged if you would circulate it. Erroneous impressions of this nature should be easily removed when the opinions of medical men are given.

Weak on Hills and High Petrol Consumption

I recently bought a second-hand motor cycle (1907 Quadrant) supposed to be 3½ h.p. I cannot get more than sixty miles to the gallon. I use as little petrol as possible, and drive with as much air as the engine will take. It seems to have good compression. Would not climb a hill 1 in 11. Have been told that it wants a new gudgeon pin and new rings. Would this alter the consumption? Engine knocks in climbing a hill 1 in 16. Carburetter clean. I retard the spark when knocking begins, but this does not stop the knocking.—W.A.F.

The fact that the piston rings are not a good fit will have some effect upon the consumption of the engine. Have the latter thoroughly overhauled and replace any worn or defective parts, and then turn your attention to the carburetter. The carburetter, if properly adjusted, should enable the machine to start easily and take all the extra air when running at full speed. The consumption should be between eighty and ninety miles to the gallon. The knocking is probably due to the worn gudgeon pin referred to, or to excessive carbon deposits on the piston head and cylinder. Worn valve cams would account for weak hill-climbing.

Carburetter Warming Pipe and Grinding Valves.

My engine is air-cooled by the aid of a fan; it is 86 by 89, and runs very satisfactorily and does not overheat. (1.) Would there be any advantage in connecting a pipe from the silencer to the carburetter (Longuemare)? (2.) Would it make the mixture more explosive? (3.) Would there be any chance of setting fire to the carburetter when explosions occur in the silencer? (4.) Would it increase the chances of overheating the engine by warming the incoming gas? (5.) I have great difficulty in grinding my inlet valve (I use Carborundum powder). It will not touch the valve, but only grinds the seating. I have tried to get through the surface of the valve by rubbing it with emery paper, but it will not touch it, and it remains a black polish. It is not pitted. Can you help me?—A.L.

14.) In the summer months a warming device for the carburetter should not be necessary, and we do not recommend it. There would be no chance of setting fire to the carburetter, as the pipe is led into a jacket so that the hot air does not come in contact with the petrol. Certainly, if you fit it in the hot weather, and the engine is running satisfactorily, it might tend to over-heating. (5.) 'As long as the face of the valve is not pitted we think you need not worry.

READERS' REPLIES.

A Mysterious Knocking.

In your issue of the 26th August H.W.D." says that he is troubled by mysterious knocking in the engine. I see that you suggest as possible causes that the gear may be too high or the magneto wrongly timed. A recent experience of my own prompts me to mention a third possible cause, viz., the need of a fresh bush on the magneto spindle. My cycle is a 3 h.p. with magneto ignition. I bought it second-hand, and it was then in excellent order except for the bush on the driving side of the magneto being decidedly worn. After riding the machine for about 2,000 miles the knocking began,

and as there was evidently nothing amiss with the engine itself I argued that the trouble must be due to the magneto. I had it rebushed and the knocking has ceased.—KNOCKED.

A Flooding Carburetter.

One of your correspondents alludes to the trouble he has met with in the shape of a flooding (F.N.) carburetter. Possibly the following may be of interest to him as well as to other users of the same make of carburetter. I have experienced flooding from the spray chamber, on the stand as well as when running on the road, arising from this cause. In the F.N. carburetter the jet tube is a "driving fit" in its seating at the base of the spray chamber, so if the jet tube is not driven high enough you get an overflow of petrol. Experimenting with my own carburetter I find that apparently the best results are obtained when the apex of the jet tube is almost 1½ in. above the outside surface of base of spray chamber. A fine needle of suitable length with the tip of one finger pressed against top of jet tube enables one to find the required measurement. Should it be necessary to alter the height of the level in float chamber it will be a job requiring considerable

neatness and care. The toggles play between two separate discs soldered on the needle. So you have to unsolder the discs, fix them in their new position, taking care to keep them perfectly true as well as maintaining the correct distance between them, and then resolder. One would think that it might be possible to obtain a better mode of raising and lowering the petrol level than this. Inspired by some hints contained in an article in *The Motor Cycle* by Mr. Hooydonk some months ago, I have had fitted to my carburetter a "needle controller," by means of which the jumping of the needle can be limited to any desired extent, and yet, at the same time, without interfering with the lifting of the needle when flooding the carburetter preparatory to starting the engine. I have made comparative tests of the petrol consumption with the "needle controller" in action and out of action. The mean of several tests under varying conditions of gradients, direction of wind, etc., works out at a difference of nearly twenty per cent. less petrol being used when needle controller is in action. The value of the needle controlling device lies not so much in the reduction of the petrol bill as in the better running obtained.—EXPERIENTIA DOCET.

A FAMILY OF BAT RIDERS.

AS a convincing proof that motor cycling is not confined to the younger section of the community, we have pleasure in reproducing a photograph of a group of seven riders of the well-known Bat pedalless motor bicycles—father, two sons, a son-in-law, and three nephews. Seen from the

well as when new. Mr. Sharpe is the second figure from the right, and is sixty years of age. The photograph was taken in his own grounds at Halton Hall. He is a particularly enthusiastic motor cyclist, and though a lover of ease and comfortable riding, thoroughly enjoys an occasional "dust up" when cir-

light the machines are 9 h.p., 7 h.p., 6 h.p., and 4 h.p. Bat-J.A.P.'s, and three 4 h.p. Bats. The three oldest machines have been in constant use for five years, and the senior member of the party, Mr. Sharpe, who is an enthusiastic rider of the 7 h.p., says they run as

circumstances permit. He considers the 7 h.p. 1908 Bat with magneto ignition superior to anything the Bat Co. have previously made, and the finest touring machine it is possible to obtain. Such enthusiasm on the part of riders speaks well for the Bat Co.'s future.

AUTO CYCLE UNION NOTES.

The Motor Cycle Tourist Trophy Race.

The arrangements for the above race, for which, by the way, there are thirty-seven entries, are now complete, and it is to be hoped that the contest will be even more successful than it was last year. A special subscription list has been opened, and motor cyclists are invited to contribute towards the prize fund, and it is earnestly hoped that this time the appeal for contributions will not be overlooked. The matter is referred to elsewhere in this issue.

The Penalty Run.

The A.C.U. penalty run, open to teams from the various motor cycle clubs, will be run off on the Woodford to Stumps Cross route on October 3rd. The Service Co., Ltd., has decided to offer a cup to the Auto Cycle Union for the team making the best performance. Any team winning the trophy three times in succession will become its possessor. In any one team not more than six riders may compete for the cup, so that all clubs, large or small, may have an equal chance.

The Autumn Quarterly Trial.

The next A.C.U. quarterly trial, over the Uxbridge-Wheatley-Banbury-Beaconsfield course, will be held on October 17th.

Permit.

A permit to hold an open hill-climb on October 3rd has been granted to the Bradford Motor Cycle Club, provided the necessary sanction from the police is obtained.

The A.C.U. London-Plymouth-London 24 Hours Run.

The A.C.U. judges have decided upon the following awards in connection with the above run, which took place on August 7th. Twenty-nine competitors took part in this arduous competition.

SINGLE CYLINDER CLASS.—(1) W. H. Bashall (3½ h.p. Triumph), error on timed section 1m. too slow; (2) W. E. Burkin (2¾ h.p. Laurin and Klement), error on timed section 2m. 30s. too slow; (3) C. H. Barfield (3½ h.p. Triumph), error on timed section 3m. 30s. too slow; (4) H. G. Cove (3½ h.p. H.G.C.), error on timed section 4m. 30s. too slow.

TWIN CYLINDER CLASS.—H. M. Bentley (5 h.p. Rex), error on timed section 3m. 30s. too slow.

LIGHTWEIGHTS.—(1) E. Clark (2¾ h.p. Douglas), error on timed section 5m. too slow; (2) G. L. Fletcher (2 h.p. Moto-Rêve), error on timed section 4m. 30s. too slow.

THE 5½ h.p. O.T.A.V. RUNABOUT.

BEING well aware that motor cyclists who are anxious to take a passenger with them on their journeys have a leaning towards a vehicle built on motor cycle lines, which possesses at the same time the advantages of a small car and the simplicity of the bicycle or tricar, the Junior and O.T.A.V. Cars Co., Ltd., have produced the runabout illustrated herewith. The engine, which is air-cooled and has a bore and stroke of 100 by 110 mm., possesses ordinary radiating fins, but on the crankshaft there is an enclosed fan, which forces a draught of air on to the combustion chamber, which is enclosed in an aluminium casing, ensuring a continuously cool blast. The ignition is by coil and accumulator, with make and break contact-breaker, or a magneto can be fitted as an extra. The carburetter is of the O.T.A.V. automatic type. From the engine to the ball bearing countershaft, which extends transversely amidships across the frame, the transmission is by chain, and on this countershaft an epicyclic gear giving two forward speeds is fitted. The change speed is controlled by a side lever. At each end of the countershaft is a pulley which carries a rubber V belt driving the rear wheels. There is no differential, the slip of the belts equalising the difference in the speeds of the back wheels when a corner is taken. The control is by an accelerator pedal and a spark variation lever on the steering wheel. Another pedal controls the countershaft brake, and a side lever operates the brakes on the rear wheels.

A very complete list of accessories is included in the price of the vehicle—which, by the way, is most moderate—comprising all necessary tools, rubber mat, pump, horn, two acetylene lamps, and tail lamp.

A short trial run proved the little runabout to be tractable in traffic and no mean hill-climber, as it easily took two persons up a hill of 1 in 8. The company

gladly give customers trial runs up Netherhall Gardens (gradient, 1 in 7.4). The weight is said to be 5 cwts. Its reliability has been proved in the Essex Motor Club's twenty-four hours run to York and back, a distance of 399 miles being covered well within the specified time, the driver, E. E. Leverett, being eligible for a gold medal by reason of the performance. Standard Continental tyres were used,

The 5½ h.p. single-cylinder air-cooled O.T.A.V. which carried two passengers from Woodford to York and back well within 24 hours.

the size being 650 by 55 mm., and we are told these were hardly scratched on finishing the journey. The company, whose address is 117, Long Acre, W.C., are prepared to accept motor cycles in part payment for these runabouts.

The Lightweight Question.

By "IXION."

ONE of the peculiarities of motor cycling controversy appears to be that one's words are always twisted round by those who differ into bearing a meaning that neither tone nor language ever justified, and I think this distinctly applies to Messrs. Dufaux's treatment of my notes published on August 19th. Let me therefore commence my reply by quoting the opening words of my note, viz., "I do not profess to be specially enthusiastic about the lightweight motor bicycles of to-day, whatever ardour I may be able to summon up about those of to-morrow." I yield to no man in my ardent belief that the lightweight has a big future. Efficient as the 130 lbs. and 160 lbs. tourist machines are, there are simply thousands of potential motor cyclists who will never tackle a greater weight than 80 lbs. Consequently, as soon as the lightweight is as efficient as the 130 lbs. and 160 lbs. machines, it will enter upon a tremendous vogue. To my mind, it is already only short of that stage of efficiency by reason of the fact that its tyres and belts give a wholly disproportionate amount of trouble.

The Only Troubles.

An instance of this point is the fact that of the hundred or so Motosacoche I have at various times encountered on the road, I never yet saw one hung up with any other trouble than slipping or broken belts on one hand, and damaged tyres on the other. I have three or four times encountered these machines with the back tyre gashed across almost down to the beads by sharp stones; I have heard of many other instances of the same thing; and I read only the other week that one of Messrs. Dufaux's own machines was thrown out of an important trial by a similar misfortune. Furthermore, as I know only too well from much personal experience, these lightweight tyres will gash in this fashion on quite good roads at quite moderate speeds, even when the tyres are brand new; and as a rider who is jealous for the speedy perfection of a type of machine that is to assist the motor cycle movement tremendously, I shall not cease to clamour for the fitting of stronger tyres. Some of Messrs. Dufaux's competitors are already making this needed change in their specification, and I hope Messrs. Dufaux will see their way to follow suit.

A Threatening Competitor.

On the other hand, I think one statement made by Messrs. Dufaux far more calculated to arrest the lightweight movement than any words of mine, and as a private rider of lightweights I am going to give it a flat contradiction. They say it is not intended to be a serious competitor of the heavy high-powered machines. To my mind, it is not only so intended by most of its makers, but it already actually is a very threatening competitor in all respects save speed. When I am face to face with a 200 miles day's run, which I wish to make in comfort and non-stop, without exceeding a twenty miles an hour average, I would just as soon mount a lightweight as a 3½ h.p. or a 5 h.p., *if only I dare trust my lightweight's tyres and belt.* Messrs. Dufaux's actions altogether stultify their words, and I am exceedingly glad that they do. They enter their 80 lbs. 1¼ h.p. in practically every long distance trial against the 3½ h.p.'s and the 5 h.p.'s. They are entered for Edinburgh, Plymouth, and back, Land's

End and back, and for the End-to-end, and they have made many gallant showings. Messrs. Dufaux know better than I do why they have failed whenever they may have failed, but surely I am justified in applying my own long riding experience of such machines to the cases in point, and asserting that were it not for belt and tyre troubles the proportion of such failures in all makes of lightweights would have been reduced almost to zero.

Larger Tyres Essential.

In conclusion I did not invite lightweight makers to add a lot of lumber to their machines, and so spoil the very essence of their design. As regards tyres, it is highly probable that neither rims nor spokes would need strengthening if a tyre of larger section, viz., 2in., were substituted for the present size. I know this is possible, as I rode a 2¼ h.p. Buchet, fitted with 2in. tyres, and scaling 82 lbs. ready for the road, before ever the Motosacoche came to England at all. As regards belts, there are machines scaling only 80 lbs. which possess a no-trouble belt transmission. And I prove that I have actually a higher opinion of the lightweight than Messrs. Dufaux themselves, when I assert that, given 2in. tyres and a better designed belt transmission, there are three or four lightweights on the market, including the Motosacoche, which many riders would prefer to use *for all purposes* in lieu of heavier and higher powered machines. It is, to my mind, very absurd to pretend that the lightweight cannot within a short time prove itself the equal of its heavier compeers in all respects, speed alone excepted.

Will the gentleman who addressed a postcard from Norwich to Messrs. Minerva Motors, Ltd., on the 25th ultimo, kindly send his name and address to the Editor, as these details were omitted?

One of the features of the A.C.U. Land's End to John-o'-Groat's trial was the success of Price's oil as a high-grade lubricant. Out of the forty-eight machines which finished Price's air-cooled oil was employed in forty-two, and the absence of engine troubles throughout this arduous test may be ascribed to the excellent lubricating properties of this well-known oil. Price's Patent Candle Co. are making reprints of the A.C.U. judges' report, and will supply any motor cyclist interested with a copy post free on application.

Gamages, the great accessory house in Holborn, are now holding a huge stock of motor bicycle and tricar tyres, doubtless the largest of any retail store in the kingdom. This valuable stock includes the newest rubber non-skids, which now embrace Goodrich, Continental, Clincher, and Shamrock Excelsior. Mention might also be made of the wide range of all the popular sizes of well-known makes of tubes, including the Rich detachable, and the newest form of airtight butt-end—the Shamrock Excelsior. With such a turnover in tyres one can rely on the goods being fresh. Prices, too, are in many cases at a discount off manufacturers' lists, and in other cases a very liberal allowance is made for the old covers. Readers will be well advised to get into touch with Gamages when needing anything in the way of tyres.

CURRENT CHAT.

SPECIAL FEATURES.

A NOVEL LITTLE RUNABOUT. THE MOTOR CYCLE T.T. RACE.

T.T. Race Twin-cylinder Machines Predominate.

Entries for the Tourist Trophy motor cycle race reached a total of thirty-seven before the list finally closed, so that an exciting contest on the 22nd inst. is assured. There are twenty competitors on twin-cylinders, fifteen on single, and two on four-cylinder motor bicycles.

A 7 h.p. Racer.

H. V. Colver will ride a 7 h.p. twin-cylinder Matchless in the forthcoming T.T. Race, and will pin his faith to accumulator ignition. The engine is a J.A.P. with mechanically-operated valves in the combustion head, carburetter J.A.P., tyres Dunlops, and belt Shamrock Gloria. This machine has one of the three largest engines in the race.

Climbing Precipices In Switzerland.

A contributor, Mr. E. D. Fawcett, who wrote such interesting touring articles in *The Motor Cycle*, is at present staying at Chamounix experimenting with some precipices in the district on a motor car. Gradients of 1 in 2½ (surveyor's figures) are not to be lightly passed over in more senses than one. Even the Caterpillar motor would find such inclines worthy of its power.

A Motor Cycle Thief Wanted.

Mr. H. J. Crouch, of Wanstead, the other day accepted a cheque for a 1907 Triumph motor bicycle No. 107846 from a stranger, and it is alleged that the references he gave are false, and that he has no banking account. The man got clear away with the machine. He is described as being of about 5ft. 10in. in height, and has a decidedly Roman nose with a high bridge. He gave the name of John Aldon. A warrant has been taken out for his arrest.

A Probable Market for Motor Cycles.

The London correspondent of the *North Queensland Herald*, Bassishaw House, Basinghall Street, E.C., informs us that the colony of Queensland is eminently suitable for automobiles. The Attorney-General for Queensland has travelled for 3,000 miles on a car, and his chauffeur is of the opinion that Western Queensland is highly suitable for motoring. Whether or not the roads are as suitable for motor cycles as they are for motor cars the correspondent does not state.

The Smallest Twin-cylinder Engine.

The two Young-Bentinck machines entered for the T.T. Race have easily the smallest twin-cylinder engines, the

rating being only 3½ h.p. We are assured by Mr. E. G. Young, of Nottingham, who will ride one of the machines, that they are possessed of a surprising turn of speed. With such small engine dimensions their drivers should have no fear regarding the petrol allowance of eighty miles to the gallon in this class.

The Ventoux Hill-climb.

This important hill-climbing competition, organised by the Automobile Club Vaclusien, will be held on the 12th and 13th inst. It is an interesting item of news to note that prospective clients in the district of Mont Ventoux request manufacturers and dealers to take them to this celebrated hill and show them what the car or motor cycle they purpose buying can do in the way of ascending it. No wonder the event is well supported in France, and that there are numerous

J. Marshall, who finished second in the T.T. Race (single cylinder class) last year, and will bestride a 3½ h.p. Triumph this year.

entries already. Among the motor cycles entered are the Griffon, the Terrot, Magnat de Bonne, and Moto-sacoche. If the last-named machines, of which three are entered, climb the hill successfully it will indeed be a feather in their cap. The first Ventoux hill-climb took place on the 16th September, 1902, and the event has gained in popularity each succeeding year.

A T.T. Competitor.

Mr. Noel E. Drury, of Saggart, Co. Dublin, is one of the private owners entered for the T.T. Race, twin-cylinder class. His machine is a 5 h.p. J.A.P. with cylinders set at an angle of 90°, and measuring 85 by 60 mm., carburetter B. and B., handle-bar controlled. The machine is a genuine tourist except for the shape of the handle-bars, and weighs 190 lbs.

C. R. Collier's Racer.

C. R. Collier, last year's winner of the Tourist Trophy Race, single-cylinder class, will again bestride a single-cylinder mount. The engine—a 4 h.p. J.A.P.—has m.o. valves on top of the combustion head. The carburetter is a J.A.P., and this year Collier will use a magneto. His Matchless racer is finished cream and will have rigid forks with girders. Will it still be "matchless" at the end of the present month?

Western Country Roads.

A correspondent writes, "Recently returning from a tour in Devon I thought I would take the road back to London from Exeter *via* Ilchester, Wincanton, and Amesbury, instead of the Salisbury-Shaftesbury Road. Fortunately, I made a stop at Wincanton for petrol, where I was told that the military had cut the road to pieces, and that it was scarcely rideable. I turned up north to the Bath Road and so saved my tyres."

Police Traps.

A Suffolk correspondent writes us as follows: "Being a keen motor cyclist I have much pleasure in giving notice of a trap which is in operation on the Leaden Road, Colchester. The trap is in operation between the Stanway Union and the turning to Colne, a stretch of about a quarter of a mile. I do not think this trap is in operation the whole week through, but has been working lately."

There is a trap ten miles in length starting three miles from Chester and ending seven miles from Warrington.

Another between Torpoint and Liskeard in Cornwall, on the End-to-end route.

Cars and motor cycles are being timed and numbers noted at Cattistock and Holywell, on the Dorchester and Yeovil Road. There are dangerous corners at both places.

Readers who discover police traps are requested to communicate them to us for the benefit of other motor cyclists.

WHITTLES' (PATENT) LINK-GRIP

Non-slip Endless Leather Belts for
MOTOR CYCLES, FANS, Etc.

No
fastening
link
required.

Weather Makes No Difference.

PROVIDED YOU HAVE THE RIGHT
TYRES AND THE RIGHT CLOTHING.

We have told you of the tyres (and the prices), now
here is the clothing, the PRACTICAL kind:

"GAMAGE WEATHERPROOFS"

These are made in either single or double texture cloths, the former are of course considerably lower in price than the latter, but from practical experience we cannot recommend them for motoring use. The following prices therefore are for best stout double-texture materials only, the other kind will be found priced in our 100 page list.

SINGLE BREASTED JACKETS, 24/6, 28/6, 32/6, 37/6.

DOUBLE BREASTED ditto, with deep Prussian collar, 3/6 extra.

LEGGINGS, with gaiter fronts or **OVERALLS**, cut straight (as illustrated) to wear over trousers 10/11, 12/11, 16/6 and 21/- the pair.

CAP COVERS, with flap for protection of back of head, 4/6, 5/6, 6/6 and 7/11.

DON'T BUY 'CHEAP WATERPROOFS'

They are not cheap, and are not waterproof.

THE "RAMSEY" WATERPROOF JACKET with LEGGING ATTACHMENT. An admirable garment giving complete protection in the roughest weather. The leggings fold up when not in use and are buttoned inside the coatside. Prices of complete garment, stout double texture, 27/6, 32/6, 37/6.

WATERPROOF GAITER LEGGINGS, recommended to wear with the above garment. Very easily slipped on and thoroughly protecting the lower part of the leg and foot. 13 inches high with spats, 3/6 per pair.

THE "COLLINGWOOD" FULL THREE-QUARTER LENGTH COAT: double-breasted, deep collar, strapped cuffs. Heavy brown waterproof, price 40/-

LEATHER WAISTCOATS WITH SLEEVES. These save all risks of cold and chill through damp, and ordinary clothing can be worn over them. Double-breasted Black Leather with leather sleeves, all sizes, 21/-, others at 30/-, 40/-, 45/-.

Also a special line in Tan, Green, or Dark Brown, 30/-.
Get one now and be prepared for anything.

120 large page fully illustrated list post free.

THE ZENETTE WITH Gradua Gear.

What riders say about it:

Messrs. Zenith Motors, Ltd.

20th May, 1908.

Dear Sirs,—I have to express my complete satisfaction with the 'Zenette' with 'Gradua Gear.' I gave up a practically new machine of first-class make simply because I wanted more comfort on the long journeys I have to take. I went for a 70 mile run yesterday and returned feeling perfectly fresh, and not in the least stiff. The gear enabled me to soar up River Hill, and has quite proved its reliability and practicability. As tests, I tried last week stopping and restarting on the steepest parts of Brockley Hill and Netherhall Gardens, in both cases most successfully.

Believe me, Dear Sirs, etc.

25/5/08

Dear Sirs,

I think you would like to hear I am pleased with the Zenette I bought from you this last Easter. I have now ridden close upon 1,300 miles, and given it a thorough trial, and have nothing but praise to give you. I am a hard rider, riding nearly every day, and since 1902 have had many motor bicycles, but none of them come up to the Zenette. I think the control and steering is perfect, and in traffic I can go at a walking pace with your 'Gradua' Gear, and stand still with the engine running, and without getting off start again, not having to dismount and then run and jump on, as in the old days. Up hills it flies, but if wanted will either crawl up or go at a comfortable speed, and will start in the middle of a steep hill. I certainly would not be without your 'Gradua' Gear now I have once had a machine with it, and I say the same in regard to the spring frame; it is as comfortable as a car; and another thing I like is the way it will turn in any ordinary road without stopping the engine or dismounting. Yours truly, etc.

What the Press says about this unique mount:

The Daily Telegraph (Motor Editor) says: "The 'Zenette' double-spring frame is quite unique. It is designed to give absolute immunity from vibration to the rider, and it consists of two members pivoted horizontally about the centre, so as to be capable of angular movement in a vertical direction, like the limbs of a pair of scissors. The members are of a somewhat rectangular design, and are connected at each corner by tension and compression springs. The back wheel and the engine, etc., are carried on the one member, and the front wheel and the driver on the other; but any shock to the front wheels does not act directly on the rider, as it is intercepted by a central hinge between the two members, and is absorbed there by the action of it, which becomes raised or depressed as necessary. This action is entirely compensating, and the running is, therefore, most luxurious."

The People (Motor Editor) says: "My readers will probably remember that the Zenith Motor Co. have specialised for some years past in the matter of spring frames for motor cycles, and it was that particular point of the machine which I was most anxious to test. Let me say at once that the spring frame was a great success. In the old days I had a rigid frame machine, but had to give it up owing to the vibration transmitted to my poor body from the inequalities of the road surface, and my recent ride fully demonstrated to me that the one great objection to the smallest form of automobile had been done away with entirely by the four-coil springs—two in front and two behind—fitted to the 'Zenette.' As for the variable gear—known as the 'Gradua'—I have nothing but praise for it, too. I think the gear will prove an unqualified success."

TRIAL RUNS OF THIS MAGNIFICENT MACHINE MAY BE HAD (BY APPOINTMENT ONLY).

ZENITH MOTORS, LTD., 119, Stroud Green Road, LONDON, N. (Station: FINSBURY PARK).

GOLD MEDAL. London to Edinburgh.

THE CHATER LEA CARETTE.

A light, handy two-seater for
all roads and all weathers.
No water-cooling system to
freeze.

With High Tension Magneto Ignition,
95 GUINEAS.

The Chater Lea Cigarette (Reg. 512135) may be regarded as the Next Step for the Motor Cyclist, as it scores on the point of appearance, safety, sociability, speed, and comfort. In these respects it equals the orthodox light car, while it is free from the usual complications of water-cooling and a differential gear. **The Engine** is a 6 h.p. Sarolea twin cylinder 75 mm. x 80 mm., very accessibly placed. **The Transmission** is through a 9in. leather faced cone clutch to a compact two-speed gear. The driving shaft is arranged as a continuation of the engine shaft, and is carried across the machine; it terminates in a sprocket from whence the drive is by Hans Renold chain to the left rear wheel. **Rear Hubs** are of special construction and fitted with internal expanding metal-to-metal brakes. **Starting** is by usual handle, which is geared up to engine.

PROMPT DELIVERY. TRIAL RUNS BY APPOINTMENT.

Works: 114-120, Golden Lane, London, E.C.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

The M.U. and Affiliation.

The Motor Union last week received enquiries with regard to affiliation from two newly inaugurated motor cycle clubs. The secretary will be glad to answer any enquiries from clubs considering their affiliation arrangements for next year.

The T.T. Shilling Prize Fund.

As mentioned elsewhere, a shilling fund has been started to assist the A.C.U. to provide cash prizes for successful competitors in the T.T. motor cycle race on the 22nd inst. One shilling postal orders or stamps should be sent to the Secretary, the A.C.U., 18, Down Street, Piccadilly, W. *The Motor Cycle* has subscribed 100 shillings to this fund, and in forwarding the cheque for this amount to Mr. Straight, the secretary, we asked him to send us a list of names of donors for publication in *The Motor Cycle* next week.

Prizes in the T.T. Motor Cycle Race.

Lord Raglan, Lieutenant-Governor of the Isle of Man, has consented to present the A.C.U. trophies to their respective winners at the Palace Theatre, Douglas, on the evening of the 24th inst.

An Enterprising Photographer.

Visitors to the seaside may have noticed that it is considered an attraction by photographers on the sands to have an imitation motor car in which to pose their customers. We were much amused on a recent visit to Scarborough to see that one enterprising photographer had gone one better than his rivals and staged a real 1½ h.p. Minerva motor bicycle of ancient origin for his customers to sit on for the purpose of a photograph. What an honour to sit on a seven year old motor bicycle!

Danger of High Hedges.

We regret to hear of a collision that occurred between a motor cyclist, the son of Mr. R. de B. Crawshay, the well-known Kent automobilist, and a motor van. It occurred at a road corner near Bromley, and was mainly attributable to the absurdly high hedge viz., eight and a half feet at the corner and leading thereto. As a result of the accident it will be clipped to a reasonable height. The motor cyclist happily only sustained bruises and cuts, but the machine was badly smashed.

La Coupe d'Evreux.

This French race will be held on the Route de Cambolle on the 20th inst. There are classes for tricars and motor bicycles. The motor bicycles will be divided into classes for machines with engines of quarter litre and one-third litre capacity and light-weights under 66 lbs. One of the rules in the last class is that the machines must be fitted with pedals, silencer, and mudguards, and in addition the ignition apparatus and tanks must be fixed to the bicycle frame. Surely competitors have not commenced to

carry the ignition apparatus of minute dimensions in their pockets and the petrol in a pocket flask connected by a tube with the carburetter. As an official of an important contest said to us a week or two ago, "It is a difficult matter to frame rules which will cover everything."

Danger of Stray Cattle at Night.

Often have we drawn attention to the danger of stray horses being left on the open road at night, quite a number of accidents having occurred to motorists, motor cyclists, and cyclists through colliding with animals in the dark. A collision of this kind by a motor cyclist and a horse last Friday evening at Binley, near Coventry, has unfortunately proved fatal to the motor cyclist, Mr. C. W. Ripley, of Thirsk. The rider was returning to Coventry from Rugby late on Friday evening on his motor bicycle and ran into one of a number of horses roaming about the roadway. He must have alighted on his head, for he was taken home and attended to, but passed away early the next morning. So long as cattle and

miles, Martin winning easily in 3m. 55s., and the third, a five miles flying start, in which an excellent race went to Collier by ten yards in 6m. 59½s.

Motor Cyclists at the R.A.C. Meeting.

In the programme of the motor gymkhana held in connection with the visit of the R.A.C. to Norwich last week-end, one motor cycle event was included. This took the form of a potato race, in which the rider was required to drop a potato into four buckets set along the course, and returning take them out again. This had to be performed twice. Four competitors took part, the event being won by R. O. Clark on a four-cylinder F.N., A. G. Reynolds on a 5 h.p. twin Vindec being second. So dexterous did the latter show himself in the manipulation of the tubers, even to carrying them in his mouth, that he might have been potato sowing all his life. F. Straight, on a 3½ h.p. Triumph, was third.

Sirens, Whistles, and Cutouts.

The Royal Automobile Club has sent us a long circular letter for publication under the heading of "The Dust Problem and the Inconsiderate Driving of Motor Vehicles." We regret we have not space to publish the whole of this appeal to motorists, but we notice that the Club very wisely suggests that all motor cars should be provided with a reliable speedometer to enable their drivers to accurately estimate the speed at which they travel. The Club further points out that the use of sirens, exhaust whistles, and exhaust cutouts only tend to arouse the hostility of the public, and recommends their abolition. Motor cyclists can do a great deal to assist the cause also by driving carefully and using a silencer. Only a few days ago we saw a man making himself obnoxious by ambling up the wood paved street of a Midland town on an apparently home-made motor bicycle minus any form of silencer. Such exhibitions make one wish that there was no law, and that such idiots could be upset at sight.

Next Year's Improvements.

From a casual inspection of two or three new pattern motor cycles which are now in course of construction, there will be plenty of items of interest for show visitors.

Is the Tricar Dead?

We have received a number of letters and two or three articles on the above subject which go a long way towards a denial that the tricar is defunct. Some of the letters will be published as soon as space permits. The lighter form of tricar appears to be the desideratum of most motor cyclists, provided such a machine will climb all hills. Speeds in excess of the legal limit are not sought after. Hill-climbing is essentially a question of gear ratio. A three-speed gear on a light tricar would be ideal.

FUTURE EVENTS.

- Sept. 12—Motor Cycling Club Petrol Consumption Tests.
- " 12—Leeds M.C.C. Speed Contest in Temple-newsam Park (One Class Open).
- " 12—Newcastle and District M.C.C. Hill Climb.
- " 19—Motor Union Provincial Meeting at Oxford.
- " 22—The International Auto Cycle Tourist Trophy Race in the Isle of Man.
- Oct. 3—Bradford M.C.C. Open Hill Climb.
- " 3—Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.
- " 10—A.C.U. Council Meeting at Leamington Spa.
- " 17—Auto Cycle Union Quarterly Trial of Motor Cycles, Uxbridge to Banbury and back.
- " 21—Motor Union General Committee Meeting.
- Nov. 20-28—Thirty-second Annual Stanley Show, at the Agricultural Hall, Islington.
- " 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.

horses are allowed to stray loose on the road there will always be a certain risk in riding at night, and no motor cyclist should venture out without a powerful lamp, and then only proceed at a moderate pace.

Stadium Record Beaten.

Some 15,000 spectators attended the London Schools Swimming Championships at the Stadium on Saturday last. and incidentally witnessed some smart motor cycle racing on the part of C. R. Collier and H. Martin, both of whom were on Matchless machines. Three matches were ridden, and Collier also made an attack on the mile Stadium record of 1m. 3s. In this he was successful, covering the distance in 1m. 2½s. The first match was over a mile from a flying start, and Collier won by fifty yards in 1m. 10s. The second was a standing start three

Motor Union Oxford Meeting.

The programme for the Oxford Meeting of the Motor Union on Saturday, the 19th inst., has been finally arranged as follows:

- 10.30 a.m. to 1 p.m.—Committee meeting, Municipal Buildings.
- 2.30 p.m. to 3 p.m.—Meet of members. Motor cycles and cars parked in St. Giles's.
- 3 p.m. to 4 p.m.—Afternoon tea, by the kind invitation of the Oxford and District A.C., in the hall of Lincoln College (by kind permission of the authorities).
- 3.30 p.m. to 6 p.m.—Members of the University will conduct members of the Union over the colleges and places of interest in Oxford.
- 7 p.m. for 7.15 p.m.—Twelfth provincial dinner at the Clarendon Hotel. Mr. W. Joynson-Hicks, M.P., in the chair.

The meeting promises to be one of exceptional interest, and it is hoped that a large number of members will avail themselves of the arrangements made by the Oxford Club.

Mr. W. A. Matthews, hon. sec. of the Bocardo M.C.C., 6, St. Aldates, Oxford, writes: "The occasion of the Motor Union inter-club meet at Oxford, on Saturday, September

19th, would afford a good opportunity for motor cyclists to get together for the purpose of meeting one another and discussing matters of interest to the general body of motor cyclists. With this end in view, I shall be glad if you will insert this letter in *The Motor Cycle*, hoping by so doing that those willing to attend will communicate with me as soon as possible in order that the necessary arrangements may be made."

A proposal having been made that a conference of motor cyclists should be held on the occasion of the provincial meeting of the Motor Union at Oxford, on Saturday, September 19th, the Motor Union is in communication with the Bocardo Motor Cycling Club, of Oxford, as to the necessary arrangements. Motor cyclists will be very welcome to the meet at 2.30 p.m., when their machines may be parked in St. Giles. Afternoon tea will be served, by the kind invitation of the Oxford and District Automobile Club, in the hall of Lincoln College. Following this there will be a tour of inspection throughout the colleges at 3.30, when parties will be personally conducted by members of the University. The twelfth provincial dinner will take place under the chairmanship of Mr. W. Joynson-Hicks, M.P., at the Clarendon Hotel, at 7 p.m.

The Tourist Trophy Motor Cycle Race.

The complete list of entries for the Tourist Trophy Race for motor cycles, to be held in the Isle of Man on Tuesday, September 22nd, is as follows:

SINGLE CYLINDERS.

Entrant.	Machine.	Rider.
C. R. Collier	4 Matchless-J.A.P.	Entrant

J. Baxter (P)	5 Rex	"

(P) Private owner.

It will be seen that the total number reaches thirty-seven—an increase of eight over last year.

The distance is 158 miles 220 yards, which will be ridden over the St. John's, Ballacraine, Kirk Michael, Peel course, a map of which was published in last

week's issue, page 681. The course has to be covered ten times to complete the above distance.

Prize Fund for the Motor Cycle T.T. Race.

The following contributions have been received towards the fund which has been established to provide prizes, and, if possible, help to defray the expenses, necessarily very heavy, of holding this year's International Tourist Trophy Race for Motor Cycles:

Mr. A. J. Wilson	£5 5 0
Mr. J. W. Orde	5 0 0
Mr. E. M. P. Boileau	10 0
Mr. J. W. F. Tranmer	5 3
Capt. Sir R. K. Arbuthnot, Bart. ...	1 1 0
<i>The Motor Cycle</i>	5 5 0
Miss Muriel Hind	5 0 0
Messrs. Campbell-Gray	1 1 0
Triumph Cycle Co., Ltd.	10 10 0
Mr. A. G. Reynolds	1 1 0
Mr. Paul Brodtmann	1 1 0
Mr. H. C. Horswill	1 1 0
West Essex A.C.	1 1 0

Further donations will be greatly appreciated, and should be sent as early as possible to the secretary of the A.C.U. at 18, Down Street, Piccadilly, W.

The latest type of Midget Voltoo non-trembler coil is being made in the following size, 2½in. × 3¾in. × 3½in., in addition to the ordinary Voltoo coils. These coils are sold by the City Ignition Co., 14, Spencer Street, Goswell Road, E.C.

Riders of twin Vindecs or any users of motor cycles fitted with Peugeot 5 h.p. engines will be interested to know that the South British Trading Co., Ltd., 13-15, Wilson Street, Finsbury, E.C., have just introduced a new pattern adjustable pulley with removable pressed steel flanges. The pulley measures 6½in. diameter over all, and will give a range of gears varying between 3 and 6 to 1. Right and left-hand threads are used for locking the flanges, so that the action of the belt always has a tendency to keep the inside flange tightly locked against the shoulder and the outside flange against the lock. The great advantage of the pulley is that the gears are detachable for replacement when worn.

CLUB NEWS.

Leeds M.C.C.

At a meeting of the committee of the above club it was resolved to present bronze medals and certificates to all the invited riders in the Leeds-London and back competition who finished in the specified time.

On Saturday and Sunday, September 19th and 20th, a reliability trial for private owners to Scarborough and back has been arranged, starting from Roundhay Post Office at three o'clock, and returning from Scarborough on Sunday at three o'clock. Entry fee, 2s. 6d.; taken on the spot. It is proposed to hold a gymkhana in the near future.

Southern M.C.

The above club held its second mixed hill-climb last week-end, and secured a very good entry. The handicap worked out a very close finish, five seconds only separating first, second, and third. Results as follows: 1, E. K. Davies (5 h.p. Peugeot), 4s. start; 2, S. Goodley (3½ h.p. Triumph), 20s. start; 3, W. J. Jones (5 h.p. Antoine), 8s. start. The prizes, as usual, were presented as soon as the times were worked out.

Members of the House Club, please note the final winding-up meeting will be held at headquarters on October 1st, at 8 o'clock sharp.

Essex M.C.

In the list of survivors in the above club's twenty-four hours run from Woodford to York and back, we gave the name of F. W. Applebee, whereas we should have stated W. H. Applebee, who completed the ride on a 3½ h.p. Rex. The machines ridden by the successful competitors in the run were: A. G. Reynolds (5 h.p. Vindec), F. G. Smith (3½ h.p. Triumph), H. Silverlock (5 h.p. Noble), J. Evenett (5 h.p. Peugeot), E. E. Leverett (5½ h.p. O.T.A.V.), W. Smith (2 h.p. Moto-Réve), W. Pratt (3½ h.p. Phelon and Moore), H. R. Dougal (5 h.p. Vindec), A. J. Sproston (5 h.p. Rex), A. P. Howard (3½ h.p. Triumph), and J. Browning (12 h.p. Riley car).

Walthamstow M.C.

The above club held, in conjunction with the Walthamstow Town Cycling Club, a gymkhana on the 29th ult. A potato picking event, musical chairs, and carrying a glass of water face, were all won by C. W. Lee (3¼ h.p. Rex forecar).

On the 6th inst., the third round of the 100 miles for the annual dinner cup, over a course starting from Woodford to Newmarket Heath, Cambridge, Stump's Cross, and back to Epping, was run off. The following started: L. Beckers (5 h.p. twin Kerry forecar), O. C. Godfrey (5 h.p. twin Rex magneto sidecar), and J. W. Percival (6 h.p. twin Fafnir ricar, magneto). L. Beckers punctured; the other two made non-stop runs.

There will be an inter-club run to Hunsdon on the 13th inst., starting from headquarters at 10.30 a.m.

Glasgow M.C.C.

The final hill-climbing contest for 1908 was carried out on the Lennoxton, Fintry Hill, on Saturday, August 29th. The timed course was about one mile and threequarters in length, but competitors were started from Strathblane, about five miles distant, so as to take the hill with hot engines. This, and the fact that a strong wind was blowing downhill, caused several failures. The fastest times were made by C. H. MacMillan (5 F.N.), time 3m. 7s.; D. S. Baddeley (5 h.p. Baddeley), 3m. 9s.; and William Deans (4½ h.p.

C.L. Minerva), 3m. 10s. The results on formula $C \times T \times G$ are as undernoted, the first, second, and third receiving a gold, silver, and bronze medal respectively.

	Weight in lbs.	Gear.	Figure of merit.
C. H. MacMillan (5 h.p. F.N.)	388	5.93	794
W. Roberts (3½ h.p. N.S.U.)	350	5.77	715
E. L. Matthew (5 h.p. F.N.)	364	5.93	697
Wm. Deans (4½ h.p. C.L. Minerva)	327	4.45	668
A. G. Bostock (3½ h.p. Triumph)	350	4.37	660
R. A. MacMillan (5 h.p. F.N.)	388	5.93	637
D. S. Baddeley (5 h.p. Baddeley)	363	4.85	588
John C. Wilson (6 h.p. Jap)	329	3.9	538
W. S. Kong, jun. (2½ h.p. N.S.U.)	266	6.05	473
John S. Bryce (2½ h.p. Quadrant)	305	4.92	398

Accrington and District M.C.C.

A speed-judging competition was held in connection with this recently formed club on the 22nd ult., and below will be found the results. The course was from the headquarters, Rechabites' Hall, to Mytton Bridge and back home—a distance of fifteen miles. There were fourteen entries in the single class and two entries in the passenger class. T. Grainger and J. Beesley tied in the passenger class with 2.66% error.

Name and machine.	Error in minutes.
1. W. H. Walmsley (3⅔ h.p. Rex)	¼
2. L. King (2 h.p. De Dion)	1
3. H. Franklin (2¾ h.p. Rover)	1
4. H. Riley (2¾ h.p. Minerva)	2
5. H. Ironfield (4 h.p. Werner)	2
6. J. Whitehead (3 h.p. Triumph)	8
7. W. Prescott (3½ h.p. Minerva)	10
8. G. Harker (3½ h.p. Rex)	11
9. W. Taylor (2½ h.p. C.-G.)	18
10. J. Wilcox (3⅔ h.p. Rex)	13¾
11. T. Grainger (5 h.p. Rex)	13

Newcastle and District M.C.C.

A non-stop run was held on August 30th to Jedburgh and back, a total distance of 108 miles. The weather conditions were very unsettled, heavy rains being encountered at various parts of the route, especially at Jedburgh, where it was exceedingly heavy. The judges have made their awards as follows: First prize (trophy given by G. W. Parkinson), Robson Crosier (3½ h.p. N.S.U.); second prize (club silver medal), Thos. Smith (3½ h.p. Triumph); third prize (club enamelled bronze medal), L. Rosenvinge (3¾ h.p. N.S.U.). Bronze medals were awarded to the following riders who made non-stops: Capt. Sir R. K. Arbuthnot, Bart., R.N. (3½ h.p. Triumph), S. W. Carty (3¾ h.p. N.S.U.), H. W. C. Bell (4 h.p. N.S.U.), F. Mallett (6 h.p. N.S.U.), F. Holzapfel

R.A.C. meeting at Norwich on Saturday. The only event for motor cyclists at the gymkhana was a potato race, in which Messrs. Collins (2½ h.p. two-speed Anglian), F. Straight (3½ h.p. Triumph), R. O. Clark (four-cylinder F.N.), and A. G. Reynolds (5 h.p. Vindec) were competitors.

(4 h.p. C.I.E.), D. Mallett (4 h.p. N.S.U.), A. Fenwick (5 h.p. Vindec-Special), R. L. Atkinson (3¾ h.p. N.S.U.), G. S. Walker (3 h.p. F.D.W.), W. H. Outwin (3½ h.p. Triumph), and W. F. Garbutt (3½ h.p. Cheviot-Fafnir).

For September 12th a hill-climb has been arranged. Meeting place, Minsteracres Gates, Durham, at 2 p.m., then *via* Blaydon and Prudhoe. First class, single-cylinders; second class, twin-cylinders; third class, passenger machines. Winner to be decided in each class on A.C.U. formula. Entry fee, 2s.

On the 13th inst. team trials will be held. Start at 9 a.m., Barras Bridge Hotel; finish at 3, Mile Bridge, Gosforth. Minimum riding time, 6h. 45m.; maximum riding time, 7h. 26m. Stop at Kelso, Spread Eagle Hotel. Dinner ready at 12.30 p.m. Compulsory stop, two hours. Route—Morpeth, Wooler, Cornhill, Coldstream, Kelso, Crailing, Jedburgh, Otterburn, Ponteland, and Newcastle.

Club News.—

Stockport and District M.C.C.

On the 12th inst. the above club will hold a members' hill-climb. Two prizes will be given for the single class and two prizes for the twin class. A special prize will also be given for the fastest time of the day. The results will be decided on formula. A prize will be given to the best results obtained in the passenger class, *i.e.*, sidecars, forecars, and quadcars (trailers will not be allowed). Any motor cyclist wishing to enter may do so on condition he becomes a member of the club by paying a subscription of 10s. The fee for entry will be 2s. 6d. for one machine for one class. Entry forms can be obtained from the hon. sec., H. Marsden, George's Road, Stockport.

York County M.C.C.

By kind permission of the Hon. E. Lindsey Wood, the above club held its annual speed trials on a private road in the Temple Newsome estate. The events were run in various classes, according to bore of engine, the winners of each class again competing for first, second, and third.

Class 1.—1, R. Durham (3½ h.p. Triumph), Class 2.—1, C. S. Allan (3½ h.p. Triumph). Class 3.—1, C. Wilson (3½ h.p. Triumph). Final.—1, C. Wilson, who becomes the holder of the Charge silver challenge trophy and the club's standard gold medal; 2, C. S. Allan, silver medal; 3, R. Durham, bronze medal.

R. Durham made fastest time, his speed working out at 53½ miles per hour. Electric timing was used, and the times were taken by the official timekeeper, Mr. E. Simpson.

Members are requested to note that the next competition is the third quarterly trial, which has been fixed for Saturday, September 19th.

Hull and East Riding A.C.C.

The results of the Spout hill-climbing competition, held on the 29th ult., are: Class I.—1, Mrs. A. Tomlinson (2½ h.p. J.A.P.), figure of merit 8.932; 2, Mr. J. Richards (2½ h.p. Minerva), 8.775. Class II.—1, Mr. G. Bosville (3½ h.p. Triumph, 1908), 9.413; 2, Mrs. Tomlinson (2½ h.p. J.A.P.), 8.494; 3, Mr. V. Butters (3½ h.p. 1908 Triumph), 7.943. Class III.—1, Mr. O. Tholemeler (6 h.p. N.S.U.), 7.375; 2, Sergt.-Major Evans (5 h.p. Vindec Special), 5.234.

The Hull to London non-stop run on Saturday next will include controls at Lincoln, Bourne, Peterborough, Biggleswade, and Highgate (London). Competitors will leave Hull at 7.20 by ferry for New Holland. There will be a stop at Peterborough for lunch, and competitors are expected to arrive at Highgate at 6.30 p.m. The awards will be: First, club prize, value £2 2s.; second, given by Mr. C. Nicholson; third, given by the club, value 10s. 6d. Bronze medals will also be given to all competitors who complete the run by 8 p.m.

The picnic to Kelnsea and Spurn, announced for September 12th, is postponed until the 20th.

Newcastle M.C.

The annual picnic of this club was held on the 30th ult., on the Ottercaps. The weather conditions were somewhat boisterous, two heavy rainstorms being encountered, but notwithstanding this a company of about fifty members, with their ladies and visitors from the Lincolnshire and Sunderland clubs, assembled and were entertained to an "al fresco" luncheon by the captain of the club (Mr. Wm. Dunn).

Two interesting competitions were held, one of which was a "motor trap" competition, in which competitors were timed over a measured course, and had, on being challenged, to declare the speed in miles per hour at which they were travelling. Some particularly close guessing was the result. Mr. Isaac Baty (3½ h.p. Dene) was first in the class for motor bicyclists, having calculated his time within threequarters of a second; whilst Mr. Alan G. Robson (8 h.p. Minerva) in the class for passenger motor cyclists was within thirteen-fortieths of a second of his time. Mr. Frank Little (25 h.p. Weigel) took first prize in the class for motor cars.

In the tug-of-war the President's (A. J. Lucas's) team pulled Mr. Isaac Baty's team; and the Captain's team, after a very exciting struggle, were victors over the team of Mr. A. Parkin, the treasurer. In the final pull the President's team, with their superior weight, gained an easy victory.

The large party of motorists returned to Newcastle in the evening, without any untoward incident or mishap.

Crewe and District M.C.

This club's hill-climbing competition, which was held on the 29th ult., went off very satisfactorily. Nine entries had been received, but only seven faced the starter. Results:

Rider and machine.	On time.	On formula.
*A. de S. Hulton (6 h.p. Primo-J.A.P.) ...	0	6
*S. Stubbs (3½ h.p. Triumph) ...	0	2
A. M. Tatham (3½ h.p. Matchless-J.A.P.)...	+ 2½s.	1
P. S. Robinson (3½ h.p. Triumph) ...	+ 9s.	3
C. G. Edwards (3½ h.p. Triumph) ...	+ 11½s.	5
G. Harvey (3½ h.p. Triumph) ...	+ 12s.	4

*Equal in speed.

Birmingham M.C.C.

A hill-climb was held on the 30th ult. for Mrs. F. G. Sandison's prize, on Farlow Bank, Clee Hills. This hill is a particularly difficult one to negotiate, there being a right-angled corner with gradient about 1 in 6½, and a hairpin bend farther up, gradient about 1 in 5. The surface is fair, but the road is not above 9ft. wide. So difficult is it that the prize was offered for the best attempt. Two-speed gears were not allowed. The only competitor to reach the top was A. M. Lomax on a standard 1908 Triumph, and he climbed it twice in succession. The order of merit was judged, by observation, to be as follows: A. Manning Lomax (3½ h.p. Triumph), H. Rem Fowler (5 h.p. Norton), H. C. Rapier (5 h.p. N.S.U.), A. Wilby (3½ h.p. Brown), C. Winwood (5 h.p. Rex), A. Shrieves (5 h.p. Rex), H. J. Heaven (3½ h.p. Quadrant), R. W. Duke (3½ h.p. Triumph), E. C. F. Evans (5 h.p. Rex), and Reg. Samson (3½ h.p. L.M.C.).

Middlesbrough and District M.C.C.

Mr. Geoffrey W. Liddle has resigned the secretaryship of the club, and Mr. S. L. Gjertson, of 10, Bridge Street, has been appointed in his stead.

A "motor trap" competition, worked on police lines and with realistic effect, was held by the Newcastle Motor Club. Competitors were timed over a measured course, and had on being challenged to declare the speed in m.p.h. at which they were travelling.

The results of the 200 miles reliability run to Berwick-on-Tweed have now been announced. There were fourteen entries, but only half that number started. H. Fairgrieve (3½ h.p. Triumph) is the winner, his greatest disparity between controls being only .253 minute per mile; J. H. Dale (3½ h.p. N.S.U.) is second; and W. T. Walton (3½ h.p. Triumph) third. Mr. Fairgrieve also won a gold medal presented by the Triumph Motor Co. for the best performance made on a Triumph machine, and Mr. Burnett the gold medal presented by the Rex Motor Manufacturing Co. for the best performance on a Rex motor cycle.

A successful team competition was held in Cleveland, Yorkshire, on the 29th ult. Three teams competed. Competitors were allowed 2½ hours to complete the double journey, but were not allowed the use of watches. Mr. George's team (No. 2) made the best running, having an average of 2m. 20s. over the time allowed, but the team was disqualified, and No. 3 were declared winners with an average of 5m. 10s. over time.

A New Longuemare Carburetter.

MOTOR cyclists are always interested in anything introduced by the firm of Longuemare, and particularly those who possess machines fitted with this excellent carburetter. The latest form is the Model Y, and is so constructed that the control is effected by means of a single lever. The float chamber and its accessories remain as before, but the carburetting or mixing chamber O terminates at the top in a cone V, in which are three openings, which can be opened or closed more or less by means of a conical shutter U forming part of the movable barrel T, which is rotated by means of the lever S. At the bottom of the mixing chamber are holes X, from which the bottom air supply is taken. In addition, there are three large extra air openings P, also controlled by the rotation of the barrel T. At the base of the barrel T there are three openings, so shaped that

A new model Longuemare with adjustable bottom air.

they control the supply of air taken in at X. It will therefore be seen that the rotation of the single barrel T serves to control the openings X at the base, the extra air openings at P, and the throttle at U V. This carburetter, therefore, when fitted with the correct size of spray should be practically automatic, as at a given speed of the engine it will provide the correct mixture at all positions of the single lever S. However, in our experience, in the case of motor cycles with single gears it has been found expedient, up to the present, to provide a means whereby the mixture can be enriched by the closing of the additional air openings, leaving the throttle in its full open position. One lever is provided, but no handle-bar control for the lever S. It would, however, be a matter of ease to fit a Bowden wire and cable to the handles.

We have not tried a machine fitted with this carburetter, but our opinion with regard to it is that on a motor bicycle engine of small dimensions which runs at very high speeds it will probably be found to do all that is claimed for it, and on a motor bicycle fitted with a change speed gear it may also be very handy in use. On a single-gear motor bicycle at varying engine speeds we shall still pin our faith to the hand-controlled extra air and throttle working independently of one another. Readers desiring further particulars of this new model should apply to E. J. Hardy, Bishop Street, Coventry.

A Suggested Gear for the Four-cylindere F.N.

SEVERAL readers have written and asked us from time to time if it is possible to fit a change-speed gear to the four-cylinder F.N. motor bicycle. Our reply has hitherto been that the machine is so constructed that it is practically impossible to fit a two-speed gear without a number of structural alterations. However, Mr. G. H. Walker, of 3, Brentwood Villas, Albany Road, Worcester, has sent us drawings of a gear which he has designed for F.N. motor cycles, and we reproduce one of them herewith.

A is the outer member of the clutch, consisting of a cast-iron annular ring bolted to the bored out flywheel already in existence on F.N. machines. The inner member B is a phosphor bronze ring driving the primary

is mounted a sliding jaw clutch H, which can be made to slide either on feathers or on a square on the shaft. Jaws are cut in the two faces of the clutch which engage with corresponding teeth cut on the two faces of the gear wheels next to the clutch. The clutch H is moved by a lever working in a quadrant placed at the side of the bicycle. Beyond altering the position of the engine slightly, there is no difficulty in making a gear of this description and applying it to F.N. motor bicycles, but it would naturally be better and more easily built into a frame which was in course of erection. It is intended that the gear should be capable of starting machine from a standstill.

gearshaft through a flexible coupling as shown. On this shaft are fixed two bevel wheels C and D, and on an extension of the secondary shaft revolve loosely two corresponding gear wheels E and F. Between them

From time to time our contributor, "Ixion," has referred in glowing terms to an attachment whereby nipples can be attached to Bowden and other stranded wires without the use of solder. Many motor cyclists will therefore be glad to know that an exceedingly practicable device, called "Gripples," which serves this purpose has been introduced by

Mr. F. L. Anderson, 1, Farnival Street, Holborn, E.C. The device in question consists of a disc-shaped head drilled transversely and vertically, the vertical hole not reaching the bottom of the head. The wire is inserted through the transverse hole, and the rivet is driven downwards with a hammer and burred well over, when the head is firmly fixed in position. No solder is needed at all.

Letters to

the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle" 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Braking by Compression.

[3525.]—Adverting to the experiences of Mr. B. H. Davies on the Moto-Rêve, he states that after the failure of the brakes he used the compression of the engine as a retarder. Why not the two vacuum strokes (as recommended by one very prominent manufacturer) instead of the single compression stroke per cycle?

Many carburettors are now made and so fitted that the rider has no option of braking by compression. A discussion on this subject would prove interesting, and might lead to the manufacturers altering their opinion, and also their carburettors, so that their customers could employ their compression stroke or vacuum strokes at will.

ONE FOR COMPRESSION.

Belts and their Fasteners.

[3526.]—The following method as a fastener for rubber belts, which I have used for the last two years, may interest your readers. Take two pieces of leather, same width as top and bottom of belt, about 2in long. Cut off corrugations on under side of belt for about 1in. from each end, and join up with two wood screws (as illustrated). Do not punch holes in the belt, but make holes with a small gimlet and screw the screws into the belt. Put leather nuts on the top of the screws. This fastener costs next to nothing, lasts some months, screws never pull out, and it is fixed up in five minutes. I use top and bottom leather of old Watawata belts.

J. M. POOLEY.

Standard Machines in Hill-climbs.

[3527.]—In reply to the letter of the Rex Co. [No. 3523] it is obvious no remarks of mine anent secrecy and deception could apply to any advertised extra, such as the Rex ball bearings, which have been openly marketed to the public for many months past.

B. H. DAVIES.

[3528.]—I am really glad that Mr. Davies has taken up the above question in earnest. At present hill-climbing competitions prove little or nothing, and standard machines should not only be specified in the rules, but insisted upon by the officials.

I gave up competition riding some time ago, but I was present at the Coventry M.C. Newnham hill-climb, and took great interest in examining the competitors' machines, especially as I noticed the club's rules were very complete and clear, and endeavoured to bar special machines from all except the open class. One clause in the rules was:

"With the exception of Class 4, all machines must be fitted with an efficient silencer, two brakes, metal motor cycle mudguards, touring saddle, roadster motor cycle tyres, lamp, toolbag with tools weighing not less than 5 lbs., stand, and motor cycle horn. Tanks must hold at least one gallon of petrol with the exception of Class 4. Cut-outs will not be allowed."

Now, everybody dislikes grumbling, but I feel I must support Mr. Davies in his true statements. I and several

friends particularly noticed the very scanty equipment of the Triumph ridden by W. G. McMinnies, who is announced as winner of *The Motor Cycle* rose bowl. This machine was the rigid forked racer used on the Brooklands track some months ago, and did not conform to the rules in that it had 2in. tyres with smooth covers, a tiny cycle saddle, and was minus a proper toolbag, lamp, and horn. Surely none of the officials noticed the machine, but I heard two competitors complaining. Now I ask, is it fair that one rider be allowed to commit several breaches of the rules, and not be disqualified, even when competing against machines conforming to the rules? Mr. McMinnies cannot truthfully say that his machine was a standard model and equipped according to the rules, for every reader can satisfy himself on this point by referring to the photograph of Mr. McMinnies ascending Newnham Hill, on page 661 of the issue of *The Motor Cycle*, August 26th. Also note the dropped handle-bars.

I sincerely trust the committee of the Coventry Club will peruse this letter. If in face of the above facts Mr. McMinnies is allowed to have the prize, we shall all wonder what rules are for.

GERALD H. DAY.

[3529.]—Your correspondent, Mr. B. H. Davies, has earned the thanks of the whole motor cycling community by making public facts which, though well known to those who have made a study of the pastime in all its aspects, have been a constant source of disappointment and dissatisfaction to the ordinary amateur, who was at a loss to account for the apparent inferiority of his own machine.

Nothing is so exasperating as to purchase a machine on the strength of its consistent wonderful performances in open competition, only to find, when delivered, that it will fail on gradients up which the maker's special mount will fly at forty miles per hour. Of course, the makers are out to win, otherwise they would be merely wasting time and money, besides risking their reputations, and if A enters a machine with abnormally high compression, light pistons, light tyres, weight cut down to the minimum, etc., B must do likewise or go to the wall.

Nor is this state of things confined to the motor cycle industry. I remember, not long ago, a certain car, made some distance from London, was sent down south to compete in some speed trials for standard touring cars. The London agents suggested that it would be a good opportunity to clear off a number of trial runs which had been booked, but the manufacturers replied that it would be impossible to give trial runs until the car had been back to the works to have the racing engine exchanged for a touring one.

It seems to me that the only solution of the problem is to introduce trade classes in all hill-climbs and speed events, making a rule that the machines entered must be chosen from stock by the committee or officials of the A.C.U., and sealed. Of course the greatest difficulty would be in dealing with the maker's tame amateur, but I think if the latter consistently beat the trade rider on his standard machine, the public would soon draw their own conclusions. It may be some comfort to the novice to know that for all ordinary purposes his own machine is infinitely superior to the maker's freak hill-climber, which is utterly useless for touring purposes, and that it is impossible to make a machine excel in one branch of sport without sacrificing something in another.

LOOKER ON.

[3530.]—It is very gratifying to learn that the Rex Co. "would like to wipe away any suggestion" that the Rex machines at Newnham were other than standard. This being so, I should like to ask them the following questions:

1. Since when has the quaint carburetter used by their rider, Mr. G. L. Evans, been standard on their $3\frac{1}{2}$ h.p. pattern?

2. Would they mind explaining for the benefit of possible customers the purpose of the mechanically operated device on it, worked off the inlet valve tappet?

3. As Mr. G. L. Evans's $3\frac{1}{2}$ h.p. Rex was of larger bore than any other $3\frac{1}{2}$ h.p. Rex entered at Newnham, viz., 3 mm., was it a standard 1909 machine, and the others 1908, or was it 1908 and the others 1907?

4. I notice two "standard" $2\frac{3}{4}$ h.p. Rexes were entered at Newnham in Class I., both ridden by trade men. The dimensions of one engine were 82×70 , and the other 76×76 . Which is the standard, or do the Rex Co. market two different standard $2\frac{3}{4}$ h.p. machines?

I quite agree with the Rex Co. that there is no deception about their ball bearing engines. They have openly advertised and illustrated this fitment as an extra for some time past, but Mr. Davies did not name it in his complaints.

Gordon Gibson, who will ride his Tourist Trophy Triumph in the race in the Isle of Man on Tuesday week.

I should further like to ask Mr. A. W. Bentley if his "Triumph" was a "standard tourist" or a "standard Tourist Trophy"? I am not casting any aspersions on the veracity of his entry form particulars, but all entrants in Class II. were supposed to ride a machine equipped in accordance with the rules. But whether he knows it or not, I fancy there were sundry differences between his machine and my own roadster Triumph, having carefully examined his machine or myself. For instance, I do not think his wheels were anywhere near so heavy as mine, and so when he says it is "standard," I feel sure he must mean "standard Tourist Trophy," and not "standard roadster."

OBSERVER.

We published a paragraph last week containing a remark of Mr. Bentley's which was misunderstood by us. The sentence should have read, "The machine he rode at Newnham was not a T.T. model."—ED.]

[3531.]—I read with interest letter No. 3523 *re* standard machines in hill-climbs, and feel inclined to take exception to some of the Rex Co.'s remarks. Are the company prepared to supply me with a machine similar in every respect to the one ridden by the winner in the Bolton Motor Club's recent hill-climb, and which made fastest time in the Manchester Club's hill-climb, May 16th, at list price? And is it not a

fact that the $3\frac{1}{2}$ h.p. Rex that was placed second in the last named event was a special machine brought from their works by G. Lee Evans and lent to Heaton for that event? Both above machines are departures from standard models.

AN ALSO RAN.

[3532.]—The articles which appear from time to time in your valuable paper from the facile pen of Mr. B. H. Davies are always fascinating reading, and the one on the above subject in last week's issue is no exception.

Having been a very interested spectator at the Coventry Club's hill-climb on August 15th, at Newnham, may I enquire how Mr. Davies discovered that the majority of the prominent machines had a far higher compression ratio than any standard touring machine. Surely, manufacturers and their experts at hill-climbs would not give information to amateurs as to what different ratios of compression (if any) they use for touring and hill-climbing, nor is it likely that Mr. Davies went into the elaborate operations of dismantling the cylinders of the winning machines and carefully and accurately measuring the contents of their clearance volumes.

As far as I could judge, the successful machines were standard T.T. models, i.e., machines of slightly lighter and lower build, without pedals, and some without spring forks, and there is nothing to prevent any amateur from purchasing a T.T. model for general use. I saw several of them in use as touring machines in the End-to-end run. There is no reason to believe that these machines had specially high degrees of compression to enable them to develop abnormal power during the very short period while climbing Newnham Hill, in which case there is nothing to prevent any amateur with sufficient experience and time for practice from equaling, or even beating, a trade rider on one of these machines.

If, however, Mr. Davies is correct in stating that these machines had abnormally high compression for obtaining abnormal power during a short period of time, but unsatisfactory running and overheating under normal touring conditions, then I beg his pardon, and sympathise with him, for he is casting no slur on the makers, as winning a hill-climb would then chiefly depend upon structural alterations inside the engine, and not so much on driving skill and ability to tune up the engine and carburetter.

To conclude, may I suggest that it would be extremely useful and interesting to enthusiasts if the gear ratios used by competitors in important hill-climbs were always published in *The Motor Cycle*.

J. T. CLARKE.

[We should like to be able to publish gear ratios in all cases, but they are usually most difficult to obtain with any certainty of accuracy.—ED.]

Handle-bar Locking Devices.

[3533.]—I do not suppose you are frequently addressed by a patient in a hospital (do not be alarmed, this is not a hospital for infectious diseases, so there is no need to be in any fear in perusing my letter), but I feel it is my bounden duty to bring to mind again those letters on "Locked Handle-bars; Locked by other Means than by an Ordinary Friction Band," which appeared in the columns of your valuable paper a few weeks ago. I have the strongest of reasons for doing it.

The proverbial old farmer is said to have locked the door of his stable when his old friend the horse had been stolen. And this simile is quite applicable to me, for I could have avoided perhaps, by following the valuable advice which was given in *The Motor Cycle* upon this subject, the unpleasant experience of possessing a broken leg, at least twelve weeks in imprisonment to recuperate, and a spoilt holiday thrown into the bargain. My accident was simply a little drama in three little acts, viz., Act 1, handle-bars became loose; Act 2, inability to steer; Act 3, inevitable doom. Thus it happened, and now I am naturally wondering why makers do not resort to a D form sectioned stem which could not possibly turn in the steering column, and thus save customers a few broken bones and may be necks.

I wish to urge motor cyclists in general to insist on this thing being carried out on future machines.

FRED PETTY.

[As previously stated, when first our attention was drawn to this matter, the handle-bar stem must have been too small for the fork tube, or the clamping device was not properly made. On well-made machines it is almost impossible for the stem to turn.—ED.]

Lightweight Tyres and Belts.

[3534.]—I have read "Occasional Comments" by "Ixion" on tyres and belts for lightweights, and from my own experience his criticism is decidedly unfair. I rode 2,000 miles on my machine (Motosacoche) with roadster tyres (Clincher A Won roadster) without one puncture. I have since ridden another 1,800 miles on the same tyres with very few punctures. For the 3,800 miles I have used two belts, which are still good enough for spares.

With reference to buckled rims, does "Ixion" habitually ride over bricks and up kerbstones? I cannot account for his experience any other way. All my riding has been done in this hilly district (Bradford) on very ordinary roads.

R. J. MORGAN.

Round Twisted Belts and their Fasteners.

[3535.]—Owners of lightweights with round-twisted belts will find the following idea useful for tightening the belt without unhooking it, or removing it from the rim or pulley. Let a hook be made of three parts A C and B, B being a boss with a ratchet cut on one side to allow of A being turned in one direction. Or the hook can be made double, as advocated in a recent number of *The Motor Cycle*. This gives extra strength in the hook, and looks neater, as it lies inside the round belt. The belt can be tightened by twisting belt attached to A in the direction in which the ratchet is cut, and if it is desired to slacken belt it can be untwisted if A is pushed towards C so that the head D is pushed beyond the ratchet, in which case A will turn in either direction.

J. H. POTTER.

[The suggestion is a clever one, but it is not advisable to shorten round-twisted belts by twisting them too much, as they become so small in diameter as to lose their grip.—Ed.]

Footrests v. Pedals and Stands.

[3536.]—I notice that you publish very few letters in favour of pedalling gear. I have now been a motor cyclist since the appearance in this country of the little front-driven Werner, since when some ten or twelve different makes of motor cycles have been in my possession at different times, but I would not think of purchasing a machine without pedal gear, whether fitted with fixed or two-speed gear.

Pedalling gear is useful in so many ways, such as for testing machine on the stand, helping engine on greasy roads and at bad corners, for preventing side-slip by standing on them, for using as footrests occasionally—as so many different positions can be obtained and cramp thereby prevented on long journeys—and lastly, they are very welcome for warming one up on a cold winter's day by doing a little pedalling on hills (when no one is looking).

Last season and this I have been using a twin with two-speed gear, with sidecar attached, and have just completed 15,000 miles on this combination. My machine is a Vindec, which I chose for the principal reason that it has pedalling gear. To start engine, I raise the exhaust, give the pedal a half-push, put in the clutch, and away I go. When I get a lengthy traffic hold-up I stop engine, as I do not have to leave the saddle to start again, but simply give the pedal a dig. The consequence is, if I am driving all day in the thickest traffic I never overheat, which I am afraid the gentleman with the pedalless machine and miniature starting handle could not do.

It is well known that it is impossible to keep an air-cooled engine running free for any length of time in traffic without overheating. It is easily tested, as a run from Liverpool Street to Charing Cross *via* Cheapside and Fleet Street will soon prove. Last year I did 3,000 miles in London traffic, fully half of this distance being in the City and West End, and never suffered once from overheating. My machine, when loaded with baggage, spares, and passengers, weighs 700 lbs., and I have never yet met a hill in either the British Isles or France that it would not take unassisted; still I would not part with my pedals. My favourite position in riding is left foot on footrests and right foot on pedal. I ride all weathers, and do any journey up to 300 miles in a day—my choice distance being 200 miles—and I always finish fresh and without a sign of stiffness, which I doubt would be the case had I been stuck in one position all the time.

ERNEST FRASSETTI.

[3537.]—May I say a few words in reply to Mr. Wall. To begin with, *why* must we have either pedals or footrests? Surely both can be retained. For a machine to be started by a turn of the handle it must have a free engine clutch, and the pedal machine with the same advantage need not be jacked up on the stand to be started—a method which the writer of a previous letter considers so undignified.

With clutches of the Vindec type the rider can sit astride his machine and start the engine with one push of the pedal and then engage the clutch, having both feet free to balance the machine as it commences to move, so making a quick and neat start. I submit that this is much more dignified than leaning the machine on one side, reaching for the exhaust lifter with one hand and winding a crank with the other, and then go wobbling off leaning over to one side.

Anyone who has assisted at starting one of these machines when the engine is at all refractory will know what an effort is required. I know one which used to require two people to hold it steady while a third "comfortably hand turned" it for all he was worth. The footrests in this case were not much use, as the engine would not fire unless the machine was vertical. Lastly, tyre repairs obviously cannot be simplified by the absence of a stand, and long footrests are, in my opinion, very uncomfortable on a long ride.

CE 610.

[3538.]—It is to be doubted if your correspondents 3520 who signs "H. M." and 3521 who signs "Practical Experience," understand the subject matter of my letter, under the title of "Footrests v. Pedals and Stands." You will remember that these reflections were prompted by an observation of "Ixion" that footrests were less dangerous than pedals, provided there was sufficient ground clearance.

"H. M." seems to form the ludicrous idea of fitting pedals to a car—a grotesque hypothesis. He mentions the easier adaptation of pedals to a motor cycle, but omits to allude to their discomfort and superfluity under modern conditions.

"Practical Experience" discounts the utility of pedals except for the function of starting, but overshoots the mark when he represents the pedal-started motor bicycle as allowing for the same low build as a pedalless machine. Possibly, by the aid of a dropped saddle pillar, improvised rear seat on a stand or similar contrivance, the equivalent of the low seat may be secured, but at the same time any hope of the utility of the pedals vanishes.

It is imagination to assume that oil causes slip on a metal to metal clutch. Multiple disc and other varieties of metal to metal clutches run in oil. If "Practical Experience" took the precaution to use the adjustment provided for the clutch instead of jumping to conclusions, he would secure the sought-for result. I have no wish to decry any well-designed clutch and two-speed gear, provided it is in the right direction. What calls for condemnation is the weird evolution of starting a self-propelled vehicle by primitive and awkward means. Proof is exemplified in daily clutch and gear conversions effected to neighbours' products of repute, including the one referred to in your correspondent's letter.

As the originator of a device so generously accepted by all conditions of riders, I have no desire for so pronounced an expression to conflict with other firms, except on the vital point of starting handle with footrests v. pedals—a movement which students of the motor cycle realise has come into final recognition, and which will be ubiquitous on 1909 machines.

ARTHUR W. WALL.

[A number of interesting letters are held over, and will be published as space permits.—Ed.]

EXPERIENCES WANTED.

"B. W." would like to know if any reader has tried the experiment of fitting a Brown and Barlow or other carburetter to a 1908 Minerva in place of the G. and A. automatic, and with what results?

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

Accumulators

UNSPILLABLE

1908 TYPE.

Read what a private rider says (*Motor Cycle*, July 15th, '08, letter No. 3414) when answering a letter from another reader of the *Motor Cycle*, who does not use "E.P.R." accumulators.

"If your correspondent will try 'a couple of 'E.P.R.' unspillable accumulators, I think his troubles 'will be at an end. If he cares to 'do so, he can put them in his 'tank upside down, but he will get 'no acid trouble. Unlike most of 'the unspillable type, they contain 'no jelly. I have had two in use 'for some considerable time, and 'find them excellent."

No. 20c. 4 x 2½ x 6in. "Acid type," 14/6.

No. 20c /08. 4 x 2½ x 6in. "Unspillable," 17/6.

We make these unspillable accumulators in all sizes from 5 to 50 amp capacity. All unspillable types are sent out fully charged and ready for use. No loose acid to shake out. Full instructions with every cell. All batteries, whether usual type or unspillable, fitted with "E.P.R." non-corrosive terminals.

A FEW SIZES ARE LISTED HERE.

		"Acid type."	"Unspill."
The "Fleet" 4 volt 5 amp.		6/6	7/6
No. 19c	3½ x 1 x 4½	10/6	13/6
" 16r	3½ x 2 x 6	13/6	16/-
" 20c	4 x 2½ x 6	14/6	17/6
" 30c	3½ x 2½ x 6	18/6	21/-
" 40c	4½ x 4½ x 6½	25/-	28/6

REPAIRS.—We make a speciality of treating old and damaged batteries. We can either repair and make them equal to new, or else allow their value in part exchange for new "E.P.R." cells. Send for new catalogue and terms.

NOTE.—All repair work guaranteed. Minerva accumulators cannot be repaired.

Richford and Co.,

ACCUMULATOR SPECIALISTS,
153, FLEET STREET, E.C.

Established 1876.

ALVASTON Bargains. — Genuine 8 h.p. Rover cylinder, as new, 55s.; guaranteed perfect. — Alvaston Motors, Alvaston, Derby.

WHIPCORDER Riding Breeches, 8s. 6d. pair, post free; overall leggings, 3s. 11d. pair.—Fielding, St. George's Square, Hebden Bridge.

7FT. 6in. of 3in. Leather Belt, 5s.; Lohmann's Perfecta lamp, fitted with electric light, and tap for back light, 11s. 6d.; 1in. handle-bars, 3s. 6d.; 26in. by 2in. Clincher cover, 7s. 6d.; bargains.—Burnell, Ferrybridge.

FOR Sale, 1½ h.p. Chater-Lea-Minerva, surface carburetter, good going order, £4; 20 amp. accumulator, 5s.; belt pulley, ¾ by 4in., suit Antoine, 2s.; ball silencer, 1s.; all in good order.—13, St. Nicholas Street, Coventry.

MAIN-HILTON Stand Carrier, 26in., 4s. 6d.; swan-neck seat-pillar, 1in. stem, plated, new, 1s. 3d.; Ariel-Fleet engine, 3 h.p., like new, B. and B. carburetter, and exhaust pipe, £4 10s.—Siddall, Imery House, Hamilton.

SHARP'S Universal Silencer (with cut-out), with copper tubing connection (two feet), 15s.; pair XI'all spring forks (hardly used), 10s.; motor front brake, strong, 2s. 6d., or offers.—H. de B.W., Hookstile, South Godstone, Surrey.

NOTICE. BANDS!!!

(Our Speciality.)

Now is the time to have your cover fitted with a band of some description for winter riding. We strongly recommend both **Shamrock** and **Goodrich** rubber studded non-skid bands for this purpose. Our price for fitting either of these bands to your own cover is 21/-

Where a steel studded leather non-skid band is preferred we fit "Pullman," "Grose," "Brooks," or "Shaw," according to choice.

When a non-skid is fitted to the back wheel, a non-slipping band is advisable on the front. For this purpose an extra heavy "Bates" fish-back band is excellent, and we fit same to your own cover at an inclusive charge of 15/- (any size). This band may also be fitted for back wheels with advantage. Other Bates bands—heavy, 13/-; light, 11/6.

If buying a new cover, remember we allow 10/- for your old one in part payment, and are special agents for **Shamrock, Goodrich, Clincher, and Palmer.**

Whatever your requirements it will be to your advantage to write for our new "Illustrated Tyre List" (sent free). This gives particulars of our allowances, prices for all covers, and prices for retreading, fitting bands, etc.

R.O.M. (Patent) Front Wheel Stand.

Price (to fit any machine) 14/6 per pair.

R. The only contact breaker Really suitable for twins with accumulators and coils. Ensures permanent synchronism.

O. R.O.M. means—more power, easier starting, smoother running. Illustrated list free.

An Interesting Magneto Transmission.

THE actual construction of the Gianoli magneto is not very different from an ordinary two-cylinder magneto, but the difficulty of applying an ordinary two-cylinder magneto to a twin engine is overcome in a very simple and ingenious manner by the construction of the gears by which the magneto is driven.

The diagram illustrated in fig. 1 is intended to show two cylinders at an angle of 90° , the outer circle indicating the crank path and the inner circle the path of the magneto armature, which, it will be remembered, rotates at half the engine speed. The current delivered from any magneto fluctuates from a minimum to a maximum twice in each revolution of the armature. At the point of maximum current the contact-breaker of the magneto is operated, causing an ignition spark. These points of maximum current occur when the armature is nearly vertical, and obviously the two points occur exactly opposite one another—that is to say, at 180° . Turning to the diagram, the points 1 and 2 on the smaller circle represent the points of rotation of the magneto at which the maximum current is generated and at which the contact-breaker is operated. As the magneto runs at half the engine speed, it results that firing would take

FIG. 1.

place at the point marked X at *each* revolution of the crankshaft—that is to say, the maximum current point of the magneto takes place too late for cylinder No. 1 and too early for cylinder No. 2. The result of running the magneto under these conditions would be that cylinder No. 1 would be fired very much too late and cylinder No. 2 very much too early. In fact, the application of the magneto in this manner would be impracticable.

What is therefore required is that the magneto should automatically lag behind the crank at one point of rotation, so as to move the firing point X to coincide with cylinder No. 1, and at the next revolution for the magneto to shoot ahead and fire cylinder No. 2 at the correct point of rotation of the crank. Obviously to effect this a variable gear arrangement must be incorporated in the magneto drive, which changes alternately from gearing up to gearing down, causing the magneto to slow down to fire cylinder No. 1 and then to speed up to fire cylinder No. 2 at the next revolution.

This is in effect what is obtained in the Gianoli system by making the driving gears eccentric, as will be seen in fig. 2. The diagrams in fig. 3 show the two extreme positions obtained by these eccentric gear wheels in a case where two gear wheels are employed. (In fig. 2 three gear wheels are employed, but the operation will be explained in connection with two gear wheels, for the sake of simplicity.)

In the upper diagram shown in fig. 3, it will be seen that the gear wheels are so rotated that the smallest radius AB of the gear wheel fixed to the engine is in mesh with the largest radius BC of the

Interesting Magneto Transmission.—

gear wheel fixed to the magneto. To all intents and purposes, the gear wheel on the left, i.e., that on the engine, is one of small diameter, meshing with one of

MANOLI PATENT MAGNETO TRANSMISSION FOR V TWIN ENGINES.

FIG. 2.

larger diameter. The result is that the driven wheel at this point of revolution runs slower than the driving wheel. The magneto therefore lags slightly behind the engine, causing the sparking point X to coincide with cylinder No. 1. As the gear wheels rotate, the effective radius of the left-hand gear wheel increases and that of the right-hand gear wheel (the one on the magneto) decreases. The effect is therefore for the magneto to be geared up slightly until the wheels

FIG. 3.

take up the position shown in the bottom diagram of fig. 3. Here the largest radius A E of the left-hand gear wheel engages the right-hand gear wheel (the one on the magneto) at a point of smallest radius E C.

To all intents and purposes, this is the equivalent of a large gear wheel meshing with a small one, transmitting a higher speed to the gear wheel on the right, and causing the magneto to accelerate so that the firing point X is caused to coincide with cylinder No. 2.

In this manner the speed of rotation of the magneto armature, and consequently the contact-breaker, is constantly varying to slow down to coincide with one cylinder and to accelerate so that firing takes place correctly for the second cylinder.

The idea can be applied to cylinders at any angle, the formula employed for finding the angle of eccentricity of the gear wheels

being $\frac{7}{\text{angle of cylinders}}$, where two gear

wheels only are employed. If three gear wheels are employed, the divisor must be 7×2 . If four gear wheels, 7×4 , this formula determining the angle of eccentricity—that is to say, the angle θ shown on the diagram in fig. 4. After determining the angle θ from the above formula, the gear wheels must be centred at Z, the angle θ and the centre Z being the same in all the gear wheels.

FIG. 4.

This system of gearing the magneto is employed on the twin-cylinder Moto-Rêve motor bicycle with perfect results, the object being to do away with the necessity for a specially shaped and wound armature, and the system is applicable to all twin-cylinder V engines.

Naval officers ashore. Lieutenants, members of the Naval M.C., meet with their motor cycles outside the Portsmouth Dockyard for an evening spin.

A 1,000 Miles Tour by Sidecar.

DURING July I arranged to spend a fortnight's holiday on my motor bicycle and sidecar, our object being to run up to Scotland and back.

Some of my friends were of the opinion I had undertaken a big job, but I knew my machine (although practically a novice), and my wife and self now agree that it was the best holiday we ever had. We started from Gloucester at 4.45 a.m. on July 27th, the bicycle—a 5 h.p. Dreadnought-Chater Lea, with Peugeot engine, Bosch magneto, three-speed gear, and free engine—being hitched to a Mills-Fulford castor wheel sidecar. I cannot give particulars of the gear (which, however, worked most satisfactorily), as it is at present going through the Patent Office, but the maker of it is Mr. S. Sperry, Cheltenham.

We carried on the machine a two-gallon tin of petrol, a small can of Wilburine, and a spare cover, besides a regular wardrobe under the sidecar in a basket made to fit, and a cardboard box fastened at the back. I really believe some ladies would like to take the house as well!

The morning was fine and the air grand, so in the best of spirits we reeled the miles off at legal limit (not more, of course!), staying about an hour at Wellington for a second breakfast, and off again through Warrington, Wigan, Preston—in fact we followed the End-to-end route, with the exception of running round the towns to gain a glimpse of the various places. Once, while we were getting along quite comfortably, I asked my wife a question or two, and getting no answer, found she was quite at ease and fast asleep, which says something for the comfort of the sidecar. A blow or two of the horn soon woke her up, and as we were nearing the district of police traps I handed my watch over and asked her to time us over the miles in the open, so that I could be sure we were keeping within the law.

A Trap-infected District.

Right from Preston to Kendal I kept the throttle barely open, but nearing the latter town bang went the back tyre. This gave me a chance for a smoke. I patched the cover and put in a spare tube, and repaired the punctured tube ready for future events.

After restarting it began to drizzle, and as we were near Kendal we decided to halt, as we had done fairly well. I make it just 200 miles, counting the ins and outs we went. At Lancaster I felt sorely tempted to wire our friends in Scotland, saying we would try and reach our destination—321 miles from home—that night, but when the rain and the puncture caused us to change our minds, we pulled up at the King's Arms Hotel, Kendal, just after 6 p.m. I had never been over any part of the road except to Worcester.

The morning opened fine, and we made a start about 10 o'clock to see what the great Shap was like. We had just got on the flat part before commencing the climb proper, when away went the screw of the belt fastener. This, however, was soon put right, and we congratulated ourselves it did not happen on the middle of the hill. What a grand view can be obtained from Shap Fell! But I should not care to be stranded up there at midnight. During the climb the speed gear came into use. Except for this I do not think I could have got up with a passenger and the load we had on. Just before dropping down into Penrith the belt fastener pulled out again, and while putting this right, Miss Hind came up the hill in fine form, driving a car. Nothing of note happened except that we ran through a two-mile trap just after leaving Carlisle. On we

went to near Gretna, where we left the End-to-end route and travelled through Annan, Dumfries Castle, Douglas, and Kirkcudbright, thence to a village beyond named Twynholm. Tea here was most refreshing, and we had a most enjoyable time in the neighbourhood, making short trips daily from this centre until we started on our homeward journey. We returned *via* the Lakes, Ullswater and Patterdale, over Kirkstone Pass (let those with single gears try this with a sidecar and passenger, and see how they get on).

Two Exciting Incidents.

Running down into Windermere, we came across a car with a broken axle on a nasty corner; luckily for the occupants the driver managed to steer it into the bank as it ran backwards. While speaking to the driver, a man on a push bicycle came down the hill, having lost control of his machine, dashed round the corner and hit a large stone, which sent him flying over the handle-bars. I wonder he did not break his neck; but we picked him up and he soon came round. Little else happened of interest, but we were much impressed by the fine scenery among the Lakes. We stayed the night at Preston, and followed the old route home, having done as nearly as possible 1,000 miles in the fortnight. The weather was at its best, barring the evening of the first day. We had no mechanical trouble whatever. The same plugs (Bosch), same everything except back cover, which was worn to the canvas. I might say I have tried numerous first-class plugs, and my machine would fairly eat them, but the Bosch are as good as ever after the tour. I found no trouble with the sidecar, and the tyre did not require touching right through, neither did the front one on the bicycle. W. B. GIBB.

Mr. and Mrs. W. B. Gibb on the Motor Bicycle and Sidecar referred to in the accompanying article.

The pocket soldering case recently mentioned by "Road Rider" may be obtained from Leo Ripault et Cie., 64a. Poland Street, Oxford Street, W.

My Record Ride

By Arthur W. Bentley.

(Concluded from page 702.)

At last I came to cross roads, and the inevitable signpost which I was most devoutly pleased to see, as I thought that now, at any rate, I should get back on my right road.

Leaning my bicycle up against a tree, I laboriously clambered up the wall, and, striking a match—no easy task, as everything was wet—I peered anxiously at the names written on the four arms of the fingerpost.

They might have all been written in the deadest of the dead languages for all the use they were to me. I knew none of them, and I had no option but to ride along until at last I espied a house just off the road I was traversing.

Leaving my machine in the road, I went up to the front door, and knocked loudly for some minutes, and, failing in this to attract attention, I used the bell handle. At last I heard an upper window open and an angry voice assail me out of the darkness.

With many excuses and with many modest blushes I addressed myself to a gay young spinster, and after I had explained my enviable position to her I am glad to say that the voice lost a great deal of its severity, and the directions given were most precise.

If she had thought of casting a cake of soap out of the window at me I think I should most certainly have devoured it, but as she did not appear likely to do anything of the kind I thanked her, wished her a very good night, and trudged out into the darkness again.

Further Disturbances.

The story of my experiences during the remainder of the night is too painful and miserable a one to recount in detail.

Suffice it to say that a number of times was I obliged to repeat this performance, and always a voice trembling with suppressed emotion would answer from above. The owner of the voice would listen to my tale of woe, and give me directions as to the road I should take. In this manner I progressed; it seemed to be nothing but stopping, starting, climbing walls, and barking my shins. Once I nearly put a finish to the ride by coming down heavily in rounding a sharp corner I did not notice in time. All thanks for this be to my two "trusty" lamps, which were both clean out. I might really have given up at this point, but as day was beginning to break and my little steed seemed still anxious to be getting along I hopped stiffly into the saddle, and, dropping the exhaust lifter, I

pottered along until daylight found me once more on a known road at Bridgnorth.

I now practically dozed for the whole of the run into Gloucester, or rather I should say that I was in a comatose condition, and took not the least interest in anything. Nevertheless, I made really fast running through Kidderminster, Worcester, Tewkesbury, and finally into Gloucester, where Mr. Bellenger was awaiting me, having arrived in Gloucester somewhere about midnight. He had since been busy with another machine of mine he was riding, and which refused

to behave satisfactorily, and it was only a very few minutes before my arrival that he induced it to behave itself in a proper and docile manner.

Although he was standing right out in the middle of the road when I arrived, I did not slow up in the least, and should have ridden straight out on to the Bristol Road had he not caught hold of my coat as I passed, and in this manner attracted my attention, and, incidentally, aroused me from the pleasant doze I conclude I must have been enjoying.

Another Disappointment.

Upon dismounting I enquired anxiously after my breakfast, and my joy (?) can be imagined when I learnt that in no way had he been able to induce the proprietors of the hotel to prepare a breakfast for me at so early an hour, and that all he had been able to get for me was a plate of cold mutton and some warm coffee, which the "boots" had kindly but not very ably concocted for me.

I had now travelled from Perth, a distance of 388 miles (with a bad night thrown in) on five bananas, an apple, two plates of soup, and one or two biscuits, and in consequence was feeling so empty and ill that upon attempting to eat the cold mutton I felt so sick that I had to desist and content myself with the coffee, to which was added a small dose of brandy.

After drinking this there was nothing for it but to resume my little journey, which by this time I most fervently wished was at an end, as little by little my strength was leaving me, and I realised that it was touch and go whether I could hold out against this drastic challenge against nature.

Fortunately or unfortunately, I do not know which, the brandy immediately found its way into my head, and in consequence of this, for a little time, I forgot my hunger and fatigue and drove at a real good pace through Bristol, Cross, and on to Bridgwater, after which time I was in so deplorable a condition, having

Record Ride.—

and in addition to my other misfortunes several spills rounding corners too fast, that Mr. Bellenger made me dismount and drink some coffee at a wayside inn. While this was being prepared I put my head under a lamp for a minute or so, after which I managed to keep

The author with his 3½ h.p. Triumph.

going until we reached Cullompton, where I had to stop again, this time for a cup of tea with an egg beaten up in it.

Semi-dazed after 600 Miles.

I did not realise now what I was doing, and in fact I did not even know that I was driving a motor bicycle at all. I had covered the first 600 miles or so at an average speed of about twenty-six miles an hour, including stoppages for meals, three punctures, etc., and these 600 miles include some of the very worst roads I have been my misfortune to traverse in England or Scotland. Although I was too dazed at the time to remember anything about it now, I am told that frequently when I came to a hill I would practically let the machine stop before I realised what I was doing, and that when I did tumble to what was going on I would dash everything open with one fell swoop, in spite of which terrible driving the engine would at once answer to the throttle and swoop up the hills at almost full speed.

A machine that will stand the fearful jacketing that my Triumph endured during those 41h. 28m. of June 11th and 12th has nothing much wrong with it.

At last Exeter came into sight, and it appears that breakfast was ready for me, but I was so thoroughly dazed that I did not know that it was Exeter we were passing through, much less that a breakfast was ready for me, and I didn't even hear the shouts to stop that were levelled at my senseless head. I rode straight through the town, and by the time Mr. Hobgen, who had met us here, had caught us up we were miles down the road, and it was too late to turn back.

If only I could have been made to realise that I had stopped here and eat some food it might have saved the situation, but as it was I struggled on to within a few miles of Launceston, where things began to look very black indeed.

Travelling in the Wrong Direction.

From what I have been subsequently told, it appears that both Mr. Hobgen and Mr. Bellenger had trouble hereabouts, and that I continued my ride alone.

In about twenty minutes they were surprised to see me tearing back along the road into Exeter, and not taking the least notice of them, disappear round the corner. Luckily Mr. Hobgen had mended his puncture, and in under a minute was in hot pursuit, and after a keen chase caught me and made me return with him along the proper road.

Somehow or other I managed to get ahead of them again, and when they next saw me I was snugly lying at the side of the road fast asleep.

As no amount of persuasion, either gentle or otherwise, made the least impression upon my inanimate carcase, it was decided that Mr. Hobgen should ride into Launceston, and order food, etc., and that Mr. Bellenger should wait with me and see what could be done.

I do not know how long I slept there, but the next thing I remember was riding up to some hotel in Launceston, dismounting, and eating some proper food which Mr. Hobgen had carefully chosen, and which seemed just what was needed to stiffen me up for the last burst into Land's End. In a few minutes I felt as fit as the proverbial fiddle, and it was not long before we were through Bodmin, Mitchell, and Redruth, with only twenty-eight miles separating us from the coveted goal and the end of this most unlucky ride.

Knowing that we had the bicycle and also the car record safe I did not endeavour to finish at any great pace, but keeping at a steady 28 m.p.h., we ran through Penzance and out on to the last ten miles, through the winding little lanes of the most extreme south-west of England.

The Goal in Sight.

At last the Land's End Hotel loomed up on the skyline, and outside the door we saw quite a large crowd of spectators silently waiting with their eyes glued to the strip of road we were traversing.

The Land's End Hotel, the finishing point of the Record.

With a final "all out" burst the exhaust valve was lifted and we were over the finishing line, having covered the journey in 41h. 28m.

After answering a hundred and one questions about the numerous experiences that I had undergone on the way down, I sought out Mr. Bellenger, and having ordered dinner, we detached ourselves from the precincts of the hotel and went for a stroll along this beau-

My Record Ride.—

tiful coast, in order to quietly go through all the ride together from beginning to end.

We estimated that fully 930 miles had been covered, as the total distance going the best and shortest route is 886 miles, to which must be added about fourteen miles when I came back along the road before Launceston, and some thirty miles that I went wrong during the night.

Of the arrangements we had a lot to say, and next time I go I will see to this part of the programme with the greatest care, as upon successful management a great deal depends, more than can be imagined from a perusal of this short article.

Of my machine I cannot speak in high enough praise,

a broken exhaust valve being the only trouble—truly a marvellous performance—and I think the Triumph Company should be congratulated upon such a splendid machine, which, it must be remembered, was an ordinary standard touring machine (except that I had a larger tank fitted).

The rubber-studded Clincher tyres also stood up splendidly, only three nails—and large ones at that—causing stops during the whole journey. As regards the transmission, I have to thank Mr. Stanley Webb for a really first-class belt and fastener.

And in conclusion I should like to thank all those who so kindly assisted me, and to whom I owe so much.

Good luck to the next man!

Appreciation of a Two-speed Gear.

HAVING read a good deal lately about two-speed gear and free engine attachments for machines of $3\frac{1}{2}$ h.p. when used with a fore or sidecar, I feel that some experiences of my own during the last few weeks might be of some benefit to those about to experiment, or to those who are afraid, through lack of experience, to try a change-speed gear.

After a deal of reading, some personal enquiries, and a lot of thought, I decided to fit a sidecar to my $3\frac{1}{2}$ h.p. N.S.U., also a two-speed gear of that make. I had ridden the bicycle singly for about six months. After getting the sidecar and gear fixed, I started away from London to Maidstone with my brother, who weighs 12 stones, as passenger, my own weight being 11 stones. There are no hills to speak of on the Maidstone Road, and I completed the run all right. During the week following we thought of testing the two-speed gear on the Blue Bell Hill. Anyone who knows the hill will admit that it is a pretty severe test. The machine took us up quite well, but the engine got very hot through want of lubrication, and the piston seized just as we got over the crest of the rise, so we turned round and ran down into Chatham (three miles) with the gear in free engine position. We had to pedal a little, but we found that the piston had only just seized, and we managed to free it by working in plenty of paraffin.

The next journey I made was from Maidstone to Norwich. I first went to Gravesend, crossed the ferry to Tilbury, and then got on the main road for Norwich. On the occasion of this run, having no passenger, I tied a box firmly into the seat of the sidecar, with about ten or twelve paving stones to balance same.

A Twenty Miles an Hour Average.

I was able to average twenty miles an hour on the whole run, not being overloaded, and the country fairly level with the exception of one hill between Maidstone and Gravesend—a very stiff bit indeed, which would have been too much for the bicycle had I not possessed a low gear. On succeeding journeys I was accompanied by my wife, whose weight is $10\frac{1}{2}$ stones. the tour taking me from Norwich to Ipswich, then Lowestoft, Leicester, Newark, Doncaster, Penrith, Carlisle, Glasgow, Manchester, Leicester, and back to London. On the run from Penrith to Carlisle we encountered some very steep ascents, and from Carlisle to Glasgow we had a continuous climb of about fifteen miles, rendered more severe by the fact that a strong

head wind was blowing. This, of course, necessitated my using the low gear most of the time. I could not possibly have climbed this and a great many other hills but for my "emergency" gear. It is asking a great deal for a $3\frac{1}{2}$ h.p. motor bicycle to carry two passengers, weight with baggage over 22 stones, over the roads above mentioned, but we completed the tour quite successfully, averaging 125 miles a day, usually starting about eleven o'clock in the morning and

Mr. and Mrs. Harry Delevine with their N.S.U. Motor Cycle and Sidecar.

finishing about seven to eight o'clock in the evening. I did not carry a lamp the whole time, so I *had* to finish before lighting-up time.

I am not advocating the common use of a low powered machine for passenger work, but merely recording what can be done with the aid of a reliable two-speed gear, and I must say I never found it fail in its action, and it has undergone some very severe tests.

HARRY DELEVINE.

Mr. H. V. Colver, who established the new hour record for 76×76 engines of 52 miles 1,650 yards at the Stadium on 22nd August last, uses a Nilmelior coil on his Matchless-J.A.P. motor bicycle. The coil was formerly known as the Bassée and Michel, and is now sold by Nilmelior (England). Ltd., 37, Alfred Place, Tottenham Court Road, W.C.

A NOVEL BELT CLEANER.

ONE of the most practical small devices that we have yet had the opportunity of using is a belt cleaner which reached us a day or two ago.

The annexed illustration is fairly explanatory of the way in which the article is shaped, the metal part being lined inside with file-card. To the uninitiated file-card is a piece of leather to which is sewn or woven a quantity of wire bristles; these file-cards are used for cleaning out the grooves of files in factories and workshops. Every user of a leather belt knows how prone it is to collect dust, which, mixing with the grease which oozes from the pores of the leather, makes a compound which is highly conducive to slipping. The belt cleaner, which has been introduced by Warren and Co., 139, Hanford Road, Ipswich, cleans all this dirt off the sides of a belt without entailing the removal of the belt from the machine.

The same firm are introducing an air tube cleaner on similar lines, which we can guarantee will clean the sulphurous deposit from an air tube, previous to applying the repairing solution, in a quarter the time it can be removed with sandpaper or the moistened heads of matches.

A MAGNETO EXPERIENCE.

AN instructive experience befell one of our staff last week while riding a 3½ h.p. Rex engine fitted with Bosch magneto ignition, two-speed gear, and handle starting through live axle and Roc clutch. On starting up, it was noticed that something was evidently wrong, as the engine would only fire after much handle turning at a fast speed. As time was valuable, and the engine would just run, the rider pushed on to his destination, and found on arrival that the sparking plug central wire was broken off, and the gap measured at least one-eighth of an inch, yet the magneto would send a spark across this gap under compression, which is all the more remarkable as the usual gap recommended for a magneto sparking plug is ½ mm., or 1-50in. approximately. Possibly the wide gap placed a certain amount of strain on the armature of the magneto, but it shows no signs of distress. It is an excellent proof of the good workmanship and material in Bosch magneto machines. For the one above mentioned fired the charge with this wide gap for a distance of ten miles or more. When the engine was slowed down round a corner, it failed to pick up again until the engine speed was increased (by using the low gear), but, once firing, provided the gear was not changed too suddenly, the magneto continued to spark regularly. Of course, an appreciable difference was noticed in the running immediately a fresh plug was inserted, but we were under the impression that no motor cycle magneto would spark across so wide a gap as one-eighth of an inch at moderate armature speeds. One of the most successful competition riders told us the other day that he always placed the plug points 1/32 in. apart.

SPARE PARTS CASE FOR MAGNETOS.

THE neat case of spare parts which we illustrate herewith has been placed on the market by the Bosch Magneto Co., Ltd., 23, Store Street, Tottenham Court Road, W.C. It contains every spare part which is likely to be required by the owner of a Bosch magneto ignited machine, and is sold at

Contents of Spare Parts Case for DA2 Bosch Magneto.

a reasonable price. Similar cases are, of course, provided for the D.A.I. and D.A.V. magneto machines, the variation in price being trifling. The numbers and letters following each part in the inscription under the illustration coincide with the numbers and letters in the maker's catalogue.

A correspondent who signed himself "Prentice" sent us a sketch of a gudgeon pin fixing (see issue of the 26th ult.) Seeing "Prentice's" method illustrated, Messrs. J. A. Prestwich and Co., of 1, Lansdowne Road, Tottenham, N., write that they are often asked about the fixing of gudgeon pins in J.A.P. engines, and send us a drawing, which we have reproduced, showing the method they adopt. It will be seen that a pin passes right through the boss on the piston and the centre of the setscrew, and the makers assure us that they have never known this method to fail.

Letters
tothe
Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Formula in Hill-climbs.

[3539.]—The A.C.U. hill-climb formula for motor cycles cannot fairly be used in comparing two-stroke motors with the usual four-stroke type unless the cylinder capacity of the two-stroke type is doubled to allow for the fact that it is filled with mixture twice as often. Judged merely on the basis of efficiency, the two-stroke cycle is undoubtedly inferior to the four-stroke, but it may have other advantages to compensate for its want of efficiency.

H. L. CALLENDAR.

The Scott Two-stroke Engine.

[3540.]—Will you allow me to correct an erroneous impression which I find, from the numerous enquiries regarding the Scott motor bicycle, is caused in my description of the machine by the somewhat unhappily worded phrase, "customary knock"? It seems necessary to explain that this refers to the action common to all ordinary engines in which legitimate wear has taken place, but which cannot occur in my engine, at all possible speeds on the road, owing to the system of "constant thrust."

ALFRED A. SCOTT.

Silence.

[3541.]—Referring to the vexed question of efficient silencers for motor cycles, I should like to describe that which is fixed on my 2½ h.p. R. and P. motor bicycle.

The silencer consists of a round sheet iron box 6in. by 4in. diameter. Brazed into one end are about 32 tubes 4in. to 4½in. long, having a bore of about ⅜in. The position of these tubes will be seen from the rough diagram, the exhaust simply coming from engine into silencer at X.

The two ends are flanged and held in position by one bolt, with a nut on each end.

This is a very silent silencer, and as the aggregate area of the small tubes is about equal to, or slightly greater than, that of the exhaust pipe, there is practically no back pressure.

NO NOISE.

Standard Machines in Hill-climbs.

[3542.]—In answer to Mr. J. T. Clarke [3532], the commonsense of a fairly practised rider is quite enough to discern the presence of engines with extra high compression. For instance, no experienced rider could see a car like Lane's Mercedes jump off the starting line at Brooklands without realising that the engine developed an extraordinary degree of power for its size, and we know how much power in proportion to capacity is usually obtained. If Mr. Clarke rides a standard roadster of known make, let him attend the next big hill-climb, and notice how the trade entered machine, nominally the dead spit of his own, leaves the starting line. But, as a matter of fact, I had no need to rely on my own discernment unaided. Three makers have confessed to me, without invitation, and in the plainest words, that they use

engines of different compression ratios. One maker told me he turned out engines of three different compression ratios. The lowest he sold as standard, the medium he sold to speed-loving amateurs whom he could trust to handle them, and the top ratio he reserved for his own trade riders.

I think it is admitted that the trade riders would normally win the hill-climbs if every racing amateur were supplied with copies of their machines, *but what is wanted is to compress all these special machines into a class of their own*, and then obtain a class in which the private rider riding a literally standard roadster can compete against his brethren with a fair chance of securing an award.

B. H. DAVIES.

[3543.]—I read with great pleasure the articles in the two last issues by Mr. Davies upon "Standard Machines in Hill-climbs."

The ordinary amateur with his standard touring machine has no chance whatever against the trade rider on his special machine with light frame and tyres, high compression, special fuel, etc. I suggest that a solution of the problem would be to incorporate in the twenty-four hours' rides a hill-climb, to be taken after a fifty miles non-stop. Such a test as this would, I think, prevent the use of these special machines. In the A.C.U. six days trials of last year the times were taken up Birdlip, and before this was reached several special machines were knocked out.

In the present state of things the genuine amateur (not the maker's special pet amateur) has no inducement to enter hill-climbs when he knows he has absolutely no earthly chance against these special machines, which are often brought to the hill by train, make one glorious rush up, and are then carted off home.

CLAUDE H. BARFIELD.

[3544.]—Although I do not wish to be embroiled in a newspaper correspondence, I must write to defend myself and my machine against Mr. Day's attack.

My machine was a genuine Tourist Trophy model, and complied with the rules. It has been ridden this year over 5,000 miles by my diaries. Surely this is the supreme test of a genuine touring machine. Taking his objections singly—

Two-inch wired-on tyres were fitted, and were allowed by the rules; they were worn smooth by long use on the road. A Brooks motor cycle saddle was used. I borrowed a lamp in Daventry, as I never ride at night and have not one of my own. My toolbag is exactly the same as used when touring this year; it contained more than the requisite weight of spares and tools. The machine had no horn, as I find a whistle much more effective. If I choose to have rigid forks fitted, I believe I am allowed to. The handle-bars were not dropped, but were the standard T.T. Triumph pattern. The machine was ridden to the hill-climb, and back to Oxford after it.

It is surely most unsportsmanlike to protest, after an event has been run and won, and I am sure the judges had every opportunity of inspecting my machine at the time, and disqualifying it if they thought necessary.

W. G. McMINNIES.

[3545.]—I find some difficulty in accepting Mr. Davies's theory that the great differences between stock machines and trade machines at hill-climbs is chiefly due to the fact that weight is cut down. After all, the amount of weight that

can be got rid of and yet preserve a close resemblance to the standard article is not very great, and would not make much difference in a powerful motor cycle. But a huge increase in power at the expense of comfort and handiness may be obtained by using large jets and increasing compression. Now why should we not have carburettors with more than one injection chamber? With different size jets the machine might be tuned up so as to give the maximum of comfort and the maximum of power at will. Of course, if we could so alter the compression that would be still better, but there are no doubt practical difficulties in doing this.

H. M.

The Standardisation of Motor Cycle Rims.

[3546.]—When are covers and rims going to be made to some standard other than imaginary?

I have a standard 1908 Triumph, and needing a new cover, and seeing Gamage's advertisement in your paper, wrote them asking for a Shamrock Excelsior, 26 x 24 studded cover. One was sent, with Gamages' usual promptitude. It is marked 26 x 24—so is my original cover. The Shamrock Excelsior will not go on the rim. On laying the two covers on a table and carefully measuring along the beading it is apparent that the Shamrock is 2in. less in circumference than the original Clincher.

BD 552.

Routes for the Holidays.

[3547.]—In a recent issue you requested readers to forward any information to you that is likely to be useful to riders when on holiday tour. Being in London last week with my motor cycle I was very much surprised and disappointed to find that petrol is not retailed in the City. I went to six different places and was told at each that no one was allowed to stock it in the City.

Another point is, I have a London to Manchester strip map, and it advocates going to Manchester by Coventry and Lichfield. We know it is all right from London to Coventry, but the road from Coventry to Lichfield, *via* Kingsbury, is very lumpy, and not at all easy to find.

R. WHALEY.

Many riders travel *via* Stonebridge, Coleshill, and Bassetts Pole, but that is not much better, owing to the state of the surface between Coleshill and Bassetts Pole.—ED.]

Is the Tricar Dead?

[3548.]—With reference to your comments on the tricar and its popularity, I think you are certainly right in advocating the light and simple type of machine. One of the chief drawbacks to the tricar has been the short life of the back tyre, owing to the inefficient or non-springing of the frame (this has much to do with the life of a tyre) and the high power which it has had to transmit. Therefore, if by the aid of a good change-speed gear we can do away with high power and water-cooling, and consequently lighten our machine, then, with the adoption of a good system of springing, we have done much to ensure long life to the tyres.

There is another thing very essential to a passenger machine, and that is the ability to start from a standstill slowly and smoothly. A machine which is harsh and jerky in its drive can give little pleasure.

It seems to me that there is the possibility of a fine little tricar in a machine embodying the Gradua gear and system of springing as introduced by Zenith Motors, Ltd. Such a vehicle, and with a 4 to 5 h.p. twin air-cooled engine and magneto ignition, would be a delight, and surely receive a large amount of appreciation.

I venture to make this suggestion on account of a run of seventy-five miles which I recently had in a sidecar attached to a Zenith motor cycle. The way in which this run was accomplished was an effective demonstration of the utility and value of a good speed gear. And this was done with an air-cooled engine of only 3½ h.p., single cylinder.

The tricar has certain possibilities which, as you say, should ensure its recognition as a vehicle of value, provided the right type is placed on the market.

G. H. JONES.

[3549.]—With reference to your article *re* moderate-powered tricars, I herewith enclose a photograph of my tricar, which I think is a type that would meet with general approval in this country if marketed. The machine is a

4 h.p. Mototri Contal, water-cooled, single cylinder. Transmission is by pinion on engine-shaft to large pinion on counter-shaft, thus getting a reduction gear, then from counter-shaft to road wheel by Hans Renold chain. The rear wheel hub contains an epicyclic two-speed gear and metal to metal clutch, the low gear is operated by a pedal on left of machine, while a pedal on right operates clutch and brake. The clutch can be held out permanently by a small lever on top tube of frame; this is, of course, for starting purposes. The starting handle is on counter-shaft, which is an obvious advantage. Dry cells were fitted, and although they were satisfactory I have substituted two P. and R. accumulators. Control was originally by spark only, but I

have now fitted a throttle; 2½in. tyres are fitted to all wheels, the back being a studded cover. The front of frame is sprung, and the coachbuilt seat is bolted direct to the chassis; under the seat is a capacious tool or luggage box, while under water tank are two cupboards for sundries.

I have just returned from a fortnight's holiday on this machine, and with the exception of two punctures and cleaning trembler blade I have had no trouble at all. I can climb the majority of hills on top gear, while the low will take me up practically anything. I made a non-stop run of about seventy miles on a day when it poured in torrents, but in spite of the heavy rain the engine did not even misfire, although I got several shocks when switching off in traffic.

MODERATION.

[The Mototri Contal has been illustrated in our pages on several occasions and described in our reports of the Paris Salon. It is easily the most popular make of tricar in France.—ED.]

Motor Cycle Finish.

[3550.]—I have noticed in your paper a letter signed "First Aid," and I can fully endorse everything stated therein. I had great difficulty in obtaining "Robbialac," and when I did obtain it, it was in a colour which is not conducive to the good appearance of a motor cycle after the weather we have been having of late. It was white, and I must say the appearance after a week of mud, slush, petrol, oil, etc., surprised everyone who has seen the machine. After the application of hot water with a spoke brush my cycle returned to its former new condition.

I have tried every other enamel and compound advertised, and have met with nothing but failure. A decorative enamel is absolutely unsuitable for the hard wear entailed by a motor, and I am sure my brother motorists will bear me out in this.

MOTORIST.

[The enamel should, of course, be stoved. There is no doubt about the better appearance of a machine after a run on ordinary roads if enamelled French grey in comparison with black. The one looks clean, the other shabby. London mud on a white frame would, of course, look bad.—ED.]

Magneto Covers and Short Circuiting.

[3551].—Messrs. Bosch do the patent leather covers a great injustice when they say they cause short circuiting, as the misfiring will occur with fibre covers unless the following precaution is taken. Fit tightly over the cable a piece of rubber gas tubing 2in. long where the cable goes through the round hole in cover, and see that tube and cable fit the hole in cover tightly. It is the water running down the cable on to the terminal that causes misfiring. As an extra precaution vaseline the terminals.

ENAMELLED LEATHER.

[3552].—In *The Motor Cycle* of September 2nd you published our letter on magneto covers. When writing this we understood that the enquiries made regarding such covers had reference to those made from leather, and our remarks were correct as far as leather is concerned. One of your readers who happened to notice our letter communicated with us regarding his experiences, and we requested him to forward the cover in question for our inspection. On testing same we find that the material from which it is made is not leather, neither has it in its composition any rubber at all. It is difficult for us to say from what material it is made, but in any case we find it to be an absolute conductor of electricity. We think it advisable for you to mention this matter again in your next issue, as every purchaser of such a cover will experience the same difficulties, as contact or close proximity of the cover to a high-tension conductor will produce short circuit.

We are endeavouring to find out who are the manufacturers of these covers, and should we be successful we will endeavour to put them right in the matter and advise them as to the correct material to use.

THE BOSCH MAGNETO CO., LTD.

Running on Naphtha.

[3553].—In answer to Mr. Bellerby's letter in your issue of August 26th, I beg to point out that I did not recommend naphtha as a motor spirit, but simply stated that I was running on it, and that it was giving fairly satisfactory results at the time. Also giving the address of the firm who supplied me with sample. My experiences since then have, however, been anything but pleasant. I much regret my error in the specific gravity, which was due to a faulty hydrometer. The fact of my engine starting easily from cold led me to believe my figure was correct. Using a new hydrometer I find specific gravity to be 0.915.

The engine starting from cold may be due to the fact that the more volatile constituents of the spirit evaporate at a low temperature, leaving the heavier parts, creosote, etc., in the float chamber and jet tube. After three or four days' running I found that the percentage of solid matter had increased to such an extent that the spirit had turned a tarry black, and cleaning the carburetter out every five miles became a necessity owing to the clogging up of the fine jets. I was back on petrol inside a week, convinced that the ordinary carburetter is not suitable for crude naphtha. I shall be very pleased to publish the results of my fuel tests through *The Motor Cycle* when completed, as the results should be of great interest to motor cyclists, to whom your paper is almost a necessity. Thanking you for past help.

CYRIL V. ABRECHT.

Footrests v. Pedals and Stands.

[3554].—Referring to your correspondent, "Practical Experience" [letter No. 3521], I quite agree with him with regard to the 1903 Roc two-speed gear. I ride a 1903 5.6 h.p. twin Roc, fitted with the two-speed gear. The greatest trouble is the clutch slipping (top gear clutch being the worst sinner) through oil getting on the bands. I might say I know one or two riders who are in the same street with clutch troubles. The way I get over the difficulty is to squirt petrol on to the clutch bands about every fifty miles, and then they grip well.

Mr. Wall himself tells us it is imagination that oil causes slip on a metal to metal clutch; multiple disc and other varieties of metal to metal run in oil. The question is, does the Roc clutch run in oil? There is a vast difference between running in oil and being splashed with oil from the gears. To

my mind the latter is the cause of the slipping, by the very fact that after being washed by petrol, it at once begins to perform its duties as it should. As to taking the precaution to use the adjustment provided for the clutch, mine was adjusted to its greatest extent some two months ago, so in this respect I should still have been looking for the "sough" for result."

Another correspondent [No. 3537] remarks about starting I find no trouble in handle starting, and as to pedals, on my previous mounts they were always getting bent or broken. As to footrests, they are very handy, but a stand is still necessary for many purposes. Also, this correspondent says he has seen it take three persons to start these machine with handle starting, and that the machine will not fire unless in a vertical position. If the machine is in good order and flooded well, and the magneto is in tune, there is no reason why it should not fire while resting on the footrests, in any case to get a start. My engine has run two or three minutes with machine resting on the footrests without a single misfire.

In conclusion, I for one am still looking for a permanent cure for a slipping clutch without using petrol.

P. H. LANGTON.

Brown Paper Joints. A Warning.

[3555].—I recently purchased a second-hand 1907 3½ h.p. Triumph bicycle, and after running it for some time I found that the joint between crank case and cylinder was leaking very badly. I tried to tighten this up, but could make no impression on it. I put in a brown paper washer soaked in raw linseed oil, and screwed up the four nuts on the studs which hold the cylinder in place.

The next time I went out on my machine after running about fifteen miles I happened to stop, and noticed that a small crack had developed just along the bottom of cylinder. I had still some twenty miles to go before getting home, but it looked a very small thing. This distance I covered at good speed and arrived home in safety.

On the following evening I had a short distance to go (about two miles). I examined the crack and it looked very small, so I thought I would risk it, especially as I had covered twenty miles after having first observed the crack and it seemed no worse. I had just started off down the road, and had not gone more than twenty or thirty yards when an explosion took place and the machine stopped instantly, portions of the cylinder being blown right across the road.

On taking off lower rim of the cylinder which was let on the crank case, I found embedded in the piece of paper from which the joint was made a hard substance just like a small flattened pea, which did not allow the cylinder to be down accurately. I attribute the cracking of the cylinder to the fact of overstraining the snug owing to its being overhung from the top of this hard material in the paper.

I am sending you this little account, which if you think fit you might publish, not because I do not think very highly of the Triumph machine, but to warn any other rider of an machine from looking lightly on a slight crack.

Glasgow.

ALEX. CRAIG.

[A number of interesting letters are held over, and will be published as space permits.—Ed.]

EXPERIENCES WANTED.

"Rothbury" would like readers' experiences of the National two-speed hub.

If any of our readers happen to know of a suitable device for facilitating the carrying of golf clubs on a motor cycle "H. W." would be glad to have particulars.

"F. W. F." would like readers' experiences with the Auto-clipse and Hella motor cycle lamps, especially the latter.

NOTICE.

Two Years' Experience of the Twin Vindec.

By B. H. DAVIES.

WHEN one is lucky enough to hit upon a really sound motor, it is one's plain duty to one's brother motor cyclists to publish the fact, and as I have now had two years of extraordinarily regular and faithful service from Vindec twins, I should like to describe some of the excellences of these machines. I should estimate that I have probably covered upwards of 10,000 miles on Vindec twins, and in this distance I have required absolutely no large replacements, and have only encountered a single awkward stoppage. That came very early in my experience with them, and was due to the spark advance rod from the tank lever to the magneto receiving a blow. This set the brass timing lever out of truth on its bearing, and as a consequence the fibre ring rapidly wore down, and one day the engine, after a short period of feeble running, stopped altogether. I found there was no spark at the plugs, and after uncovering the magneto contact breaker, I found the platinum points were not breaking. I happened to have a small court plaster case in my pocket book, and a little strip of plaster laid on the place where the missing cam had once existed restored the "break" at the points, and enabled me to get home. While waiting for a fresh fibre ring, it dawned upon me that if I lowered the fixed platinum point, the heel of the bell crank would press further out towards the fibre ring, and so I scraped some metal off its bed, and, hey presto! the "break" was restored with the worn ring. The break being now too big, another little piece of plaster was cut in washer form, and pierced centrally, to go under the moving platinum on the bell crank, and then the break was correct again.

Only Minor Troubles Experienced.

Apart from this my stops with the twin Vindec have consisted solely of the following: Sparking plug troubles, choked jets, punctures, and mud on the H.T. terminals of magneto, when riding without a cover. The Truffault spring forks are the best on the road, and reduce the vibration to such a point that in the distance named I have only had two bits of the machine drop off, viz., a nut off the exhaust valve lifter rod, and one exhaust valve cotter. I have never had a serious skid with a Vindec on which I had retained the belt drive. I have converted to chain drive, and even with that can only remember one bad skid, due to hitting an unsuspected patch of slime at very high speed. In climbing hills with them I like a gear of about $4\frac{3}{4}$ to 1, which dispenses with the necessity for a rush, though with uniform rushing and a higher gear, they will romp up the worst hills.

Given speed, comfort, and entire reliability, the question as to whether a machine may be ranked in the highest class or not is answered by the way in which it maintains its power. No machine—and particularly no twin-cylinder machine—can maintain the very pink of perfect compression and adjustment indefinitely, and the Vindec is no exception to this invariable law. But I know no twin which will maintain its power quite so well, either in a racing or a touring sense.

Maintenance of Maximum Power.

As regards maintenance of racing power and adjustment, I once drove mine 150 miles to the scene of a hill-climb, after tuning it up, and on arriving at the hill found it needed absolutely no attention; it was

simply laid aside till the time for starting, and then won. That lesser degree of perfection which suffices for touring purposes is also excellently maintained. In about 1,000 miles of hard work the maximum pace drops about five miles to the hour, and the attention required to restore the original kick then consists of pulling out the inlet valve springs and grinding in the exhaust valves, while if a two-speed be fitted, as is normally the case with mine, the exhaust valve springs may be burnt out and need replacing.

The engine brasses will stand a year's work with a variable gear and a sidecar; they would probably stand two years with solo work and the belt drive. All cylinders wear appreciably in two years, and especially with a very high speed engine, heavy load, and two speeds. The upper part of the Vindec bore will wear

The latest Phelon and Moore two-speed gear chain-driven motor bicycle, which was ridden in the Motor Cycling Club London to Edinburgh 24 Hours, Ride and the Essex Motor Club 24 Hours' Ride Woodford to York and back by W. Pratt, in both of which events a gold medal was gained.

under the trying conditions referred to, to the extent of about $1\frac{1}{2}$ mm. The hasty amateur may then leap to the expense of two new cylinders and six new rings, at a cost of about £3. Some recent notes in *The Motor Cycle* have shown us a more economical treatment. When new in 1906, my Vindec 75 mm. piston was fitted with narrow rings with slot cut ends. This year the same piston was refitted (after two years with sidecar and low gear of 10 to 1) with 76.5 rings, double width, and with step cut ends; the ring grooves were, of course, turned out to double width—an economical method of restoring the piston and rings to a true fit.

I have only one complaint against the standard machine, and that is, the carburetter, as sent out, seldom supplies as much extra air as the engine will take when running all out on a hot day. I therefore drill the inlet pipe, and fit a loose slide over the orifice, running with this wide open in hot weather as soon as the engine is started, and governing by the hand lever on the tank. In conclusion this machine is as smooth, reliable, and speedy a mount as any motor cyclist could desire to own, and will keep running without constant attention and without replacements.

OCCASIONAL COMMENTS.

By "IXION."

Variable Pulley Gears.

I regret to see so many designers wasting time and money upon that type of variable pulley the diameter of which can be varied by a lever without pausing or dismounting. The ordinary dismount-to-adjust type of variable pulley supplies most solo riders with all they need, and the variable pulley presents grave defects from a passenger enthusiast's point of view, for not only is the ratio of his low gear limited by arbitrary considerations respecting the necessary diameter of the crankshaft and the pulley, but, further than this, just when he wishes his belt to have the most prehensile grip, *i.e.*, in climbing the steepest hills, the pulley is at its very smallest diameter, and his gear is still insufficiently low. One or two really sound gears of this type may certainly expect a decent vogue, but there will by no means be room for all the inventors now assailing motor cycles in this point to repay the cost of their experiments, much less to amass a round profit.

Stripped Timing Gears.

I have a letter from a reader who has thrice replaced his timing gear pinions in one year, owing to stripping of the teeth; his machine, incidentally, is fifth or sixth-hand, and rather ancient. I should like to remind him that to merely replace damaged parts with identical counterparts is a very short-sighted policy; there is always a reason for fractures, and in the case of these pinions it is not at all likely that inherent weakness of the pinions is the cause, as the gears are usually cut by a good firm of engineers, and are amply strong enough for the light work they have to perform. For the benefit of other sufferers I will suggest a few causes. In cases where one set of pinions fails, and the failure is not repeated, the smash is almost always due to a pin coming adrift and jamming the wheels. The cure then is to use a longer pin, so that the thin end projects a trifle from its hole, and can be burred over slightly. When the trouble is repeated a defect in some other part is casting an unnecessary strain upon the teeth. Such strains are variously caused by overstrong valve springs, a bent or close fitting valve stem jamming in its guide, loose fitting tappets jamming in their guides, worn mainshaft or camshaft brasses, preventing the pinions from meshing accurately, and so on. A careful examination of the damaged set will often reveal the cause. If the stripped teeth happen to be those which are in mesh as the valve is lifted, the fault is likely to be one of the above points causing an obstruction to the lifting of the valve.

Petrol Spraying Out of Air Inlet.

One of our contributors in an account of the End-to-end described how Mr. J. O. M. Dixon suffered from a spraying of liquid petrol from the extra air intake when his machine was on the run, although there was no flooding with the machine stationary, and although the inlet valve appeared to be in perfect order. My correspondent says he has been afflicted with a similar trouble, and in his case the trouble was due to the spraying cone of his F.N. carburetter being set too low down, so that it impinged too closely upon the jet, and the petrol hit the cone before it had

time to spray properly. Consequently no adjustment of the level of the spirit in the jet or of the inlet valve effected the slightest improvement. He put in a shorter jet tube and altered the collar on the float needle till the level was right for the shorter jet, and the spraying promptly ceased. If, as I believe, Mr. Dixon's machine has an F.N. carburetter, it will be interesting to hear whether this is the solution of his trouble also.

Lubrication.

The one detail in which the motor cycle has made no advance during the last six years is lubrication. The ancient system of dismounting, extracting a plug from the crank case, and injecting a charge from a bottle or can every twenty miles soon died a natural and well-merited death, but it was only replaced by the makeshift device of a hand pump and two-way tap; and with various minor modifications this device survives on every machine but one of to-day. It survives because it is simple, cheap, and (in skilled hands) satisfactory. But it is eminently crude. Every maker knows he must expect about ten per cent. of the machines he sells in every year to visit the works as the direct result of scanty engine lubrication. Makers are further beginning to realise that over-lubrication, though preferable to under-lubrication, is not without its peculiar drawbacks. Riders are realising that for an engine to be flooded with oil for five miles, accurately supplied for five more, and then to gradually proceed towards starvation for another ten, is bad practice. When are we going to see a simple system of automatic lubrication in vogue on all high grade motor bicycles? The hand pump system is scoffed at on cars. One car came through the recent 2,000 miles R.A.C. trials and lubricated itself perfectly and automatically for the whole of the distance, without a drop of fresh oil being added to its tank. Whatever system is employed must be proof against breakage, and include a tell tale. The sight gauge of any pump or pressure system might well lie horizontally along the top tube. We are flattering ourselves that half a dozen makes of machine in this year of grace are well nigh perfect (*pace* the two-speed gear enthusiasts). Well, here is something for designers to exercise their brains upon from now till the next Stanley. The makers would have fewer engines sent back to the works, the duffer would have fewer tremors of heart, the amateur would find his power better maintained, and the skilled rider would need to dismount his cylinder less often, with a lubricating system that regularly fed the engine with neither too much nor too little oil.

The Moto-Rêve Co., Ltd., 138-142, Gray's Inn Road, W.C., have just issued a booklet on the upkeep and adjustment of the Moto-Rêve light twin-cylinder motor bicycle. The book contains clearly printed instructions with regard to the management and adjustment of this excellent little engine. All the various parts are separately dealt with, and provided with a book of instructions an owner or prospective owner of one of these machines will easily grasp the whole of the mechanical movements, as well as the adjustments necessary to keep them in perfect order.

RIDERS IN NEXT TUESDAY'S TOURIST TROPHY RACE.

1. H. Reed, Manchester (5 Dot).
2. E. G. Young, Nottingham (3½ Bentline).
3. C. R. Collier, Woolwich (3½ Matchless).

4. H. Rem Fowler, Birmingham (5 Norton)
5. C. E. Bennett, London (5 Vindec).
6. W. G. McMinnies, Oxford (3½ Triumph)

7. S. C. Perryman, Birmingham (5 Norton).
8. A. J. Moorhouse, Manchester (5 Rex).
9. W. Heaton, Stockport (5 Rex).

CURRENT CHAT.

SPECIAL FEATURES.

AN INTERESTING MAGNETO TRANSMISSION.

A 1,000 MILES TOUR BY SIDECAR.

Light Machines in the T.T. Race.

The two Bentinek motor bicycles which will be ridden in the Tourist Trophy Race on Tuesday next are fitted with Acme twin-cylinder engines which have mechanically-operated valves, the cylinders measuring 2½ in. by 3½ in. Ignition is by Bosch mag-

F. E. Barker (3½ h.p. Rex), one of the competitors in the T.T. Race (Single-cylinder Class).

neto, and the tyres are Continental 2½ in. The complete machines are stated to scale about 150 lbs. It will be interesting to note how these moderate weight twin-cylinder machines perform. Like most of the other machines in the race, they have handle-bar-controlled carburettors.

American Journalistic Methods.

As an instance of the manner in which some American cycle and motor papers are conducted, we may remind our readers of the fact that whole articles are frequently lifted from *The Motor Cycle* without the slightest acknowledgment, the principal offender in this direction being the *Bicycling World and Motor Cycle Review*. By the way, the same journal is at present making a big fuss about a record by Jacob Derosier on a 7 h.p. twin-cylinder Indian motor bicycle. Derosier rode a quarter of a mile in 13½ s., which is equal to a speed of 68.18 miles per hour. Our American contemporary says that "he rode the fastest quarter of a mile ever done on a motor cycle." It may be a quarter-mile record, but the speed has many times been beaten on this side. Cissac's ride at Blackpool on July 27th, 1905, is still a world's record, the kilometre with a

flying start being covered in 25½ s., which equals 87.3 miles per hour. Considering that 63 miles 1078 yards were covered in one hour (world's record) by Guippone at the Parc des Princes track, Paris, in 1905, there is nothing very startling in riding a quarter of a mile only at the rate of 68.18 miles per hour.

Imports of Motor Cycles and Parts.

The imports of foreign motor cycles during August have not recovered at all, the value being £2,331 lower than in the case of imports in August, 1907. For the eight months ended August 31st the figures were :

Motor cycles—	1906.	1907.	1908.
	£44,290	£42,189	£30,958
Parts thereof—			
	19,534	22,592	17,441
	£63,824	£64,781	£48,399

It would appear from the above figures that the manufacture of British motor cycles is increasing.

Exports of British Machines.

Eighty-one British made motor cycles were exported last month as against seventy in August, 1907, and sixty-eight in August, 1906. The parts, however, have fallen from £2,569 in August last year to £1,025 this year. During the eight months ended 31st August the values of the British exports were :

Motor cycles—	1906.	1907.	1908.
	£15,480	£16,093	£19,053
Parts thereof—			
	19,420	19,482	13,652
	£34,900	£35,575	£32,705

It will be seen from the above figures that, whereas the value of complete machines exported has increased, the value of the parts despatched from this country has fallen considerably.

Re-exports of Foreign Motor Cycles.

In addition to the above exports, forty-nine foreign motor cycles of the value of £1,512, and parts to the value of £6,096, were re-exported from this country during the eight complete months of the present year. Altogether the exports from Great Britain of home and foreign made motor cycles and parts reached a value of £40,313, so that the imports still exceed the exports by £8,086.

Belgian Motor Cycle Race.

The official results of the recent motor cycle race between Liège and Bastogne (a distance of 170 kilometres) are as follow : (1) Gagard (Sarolea), 100 points; (2) Lassois (Antoine), 149; (3) Dache (Sarolea), 209. The competitors were divided into two classes according to the power of the engine, and in accordance with the classification the speeds have been worked out for an average of 18½ and 25 miles an hour. Out of twenty competitors ten were mounted on Sarolea machines. The other competing machines were chiefly Antoinettes and F.N.'s.

Police Traps.

We have received information of a police trap from the top of Manchester Road, Wilmslow, to Cheadle Village, a distance of five miles. The trap is only worked at week-ends.

A timed section 220 yards long is being operated on the Shooter's Hill Road, just by the Sun in the Sands publichouse. A motor cyclist was recently stopped and accused of travelling at twenty-six miles an hour.

We have received information concerning a police trap on the Brighton Road, opposite the Red Deer, South Croydon, which is working day and night.

O. C. Godfrey, who rode a Twln in last year's T.T. Race. This year he will mount a 3½ h.p. single-cylinder Rex.

Coupe d'Evreux.

Two Herdtle-Bruneaus, three Moto-Rêves, and an Albatross have been entered for this contest, which will be held on the Route de Cambolle, near Eyreux, Normandy, on Sunday next, the 20th inst.

Motor Cyclist's Mysterious Death.

A well-known North country contractor, Mr. John Thomas Coxon, died at Holywell Village on Tuesday of last week under mysterious circumstances. He was found seriously injured on the highway on the Monday night, with his motor cycle lying close by. It is supposed that a collision occurred between some passing vehicle, and the police are conducting enquiries.

The T.T. Motor Cycle Race.

In the T.T. Race last year, it will be remembered that the first single-cylinder machines accomplished a better average speed than the higher-powered twins, but it is unlikely that history will repeat itself this year. Some experienced riders consider that an average speed of over forty miles an hour will be maintained by the winner of the twin class this year, notwithstanding the reduced allowance of petrol. Most of the competitors are now in the Island practising over the course.

Fast Running Singles.

The brothers Colliers' T.T. racers are said to have the smallest engines in the single-cylinder class, the bore and stroke measuring 85 by 76 mm., which can scarcely be called 3½ h.p. The engines will, of course, turn round at a tremendous speed with so short a stroke.

A Manchester Rider's Racer.

H. Reed's T.T. racer is a real "Dot." It is a compact looking little machine fitted with a 5 h.p. Peugeot engine, Bosch magneto, Amac handle-bar controlled carburetter, petrol gauge, rigid forks, and Dunlop tyres, and should render a good account of itself.

The Cycle and Motor Trades' Benevolent Fund.

At the monthly meeting of the Executive Committee of the above fund a bank balance of £475 15s. 4d. was reported to the credit of the current account, and twenty-one new subscribers and six new members were elected.

The A.C.U. and Affiliated Clubs.

Members of the A.C.U. and its affiliated clubs number upwards of 2,350. The Organising Committee which has charge of the administration of the scheme of affiliation has been strengthened by the addition of two motor cyclists, Messrs. A. G. Reynolds and Victor Hart. Mr. H. G. Cove, another prominent motor cyclist, will also serve on the Legal Committee, while Mr. Robert Todd, the chairman of the A.C.U., is also the chairman of the Legal Committee, in addition to filling the office of hon. treasurer of the funds of the General Committee.

Next Week's I.O.M. Programme.

The following programme will be of service to readers who are visiting the Isle of Man next week for the motor races: Tuesday, September 22nd, 9 a.m. Start from St. John's of the Motor Cycle Tourist Trophy Race, distance 158 miles 220 yards. Course, Ballacraigne, Kirk Michael, Peel (ten circuits). Wednesday, September 23rd. Car race for the Graphic Challenge Trophy between Silverburn and Foxdale; car hill-climb for the "Henry Edmunds" Trophy on the mountain road between Ramsey and the Bungalow. Thursday, September 24th. "Four Inch" Race for cars, start 9 a.m. The start is above Hilberry Corner, Douglas, Ballacraigne, Glen Helen, Kirk Michael, Ballaugh, Ramsey, Snaefell, Hilberry, Willaston, Douglas.

In the Isle of Man.

Messrs. C. B. Franklin and N. E. Drury were putting their T.T. machines through their paces on the I.O.M. course last week, but subsequently left the Island. The Rex and Triumph trade riders, we understand, left for the I.O.M. early this week.

Motor Cycles at Brooklands.

We note with pleasure that a motor cycle handicap race is announced for the next Brooklands meeting on October 3rd. This should provide a good opportunity for T.T. competitors to indulge in a little speed work on the finest racing track in the world.

The Muratti Trophy Trial.

A further stage in connection with this competition was reached on the 9th inst., when J. Stewart and C. E. Murphy (both riding 3½ h.p. Triumphs) started from Belfast to re-ride the second half of the course, both having been equal in points at the end of the trials on 22nd ult. J. J. Kennedy, another Triumph rider, was able to prove to the committee that he was equal with the two riders named, and he was allowed to go also. When the start took place at 7 a.m. the weather was favourable, but before many miles had been covered rain commenced to fall and continued almost throughout the entire day. At Ballycastle Kennedy retired after covering sixty-three miles, and the other two riders were left to complete the course. Every control was reached prompt to time, notwithstanding that at Londonderry it was necessary to ride through water nearly a foot deep. When the finish was reached both men were drenched, but they experienced no trouble whatever with their machines. On examining their check books it

was found that they had kept together throughout the day's ride and secured the maximum number of marks at every control, secret and otherwise, the distance covered being 203½ miles. The destination of the trophy is therefore still undecided, and the matter will be considered by the committee at an early date.

Police Traps.

Information has been received by *The Motor Cycle* concerning the following police traps:

Between the villages of Antony and Torpoint, on the main road to Liskeard. On the Wakefield-Bradford Road, from the Halfway House to the Stump Cross Hotels, about 400 yards in extent.

Holyhead Road, between Llangollen and the village of Vroncysyllte, four miles in the direction of Shrewsbury.

Great North Road, at Colsterworth, six miles from Stamford to a point two miles from Grantham.

From the bottom of Gonerby Hill, three miles on the Newark side of Grantham to Bennington, six miles from Newark. Four A.A. scouts patrol this section of the Great North Road.

Eastern Counties, between Scole and Harleston via Brockdish.

FUTURE EVENTS.

- Sept. 19—Motor Union Provincial Meeting at Oxford.
- " 20—Semmering Hill-climb, A.C. of Austria.
- " 22—The International Auto Cycle Tourist Trophy Race in the Isle of Man.
- " 24—"Four Inch" Car Race in the Isle of Man.
- Oct. 2—Gaillon Hill-climb, France.
- " 3—Bradford M.C.C. Open Hill-climb for Motor Cycles.
- " 3—Brooklands A.R.C. Meeting (Motor Cycle Handicap).
- " 3—Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.
- " 10—A.C.U. Council Meeting at Leamington Spa.
- " 17—Auto Cycle Union Quarterly Trial of Motor Cycles, Uxbridge to Banbury and back.
- " 21—Motor Union General Committee Meeting.
- Nov. 20-28—Thirty-second Annual Stanley Show, at the Agricultural Hall, Islington.
- " 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.
- Dec. 16—Motor Union General Committee Meeting.

"The Autocar" Motor Car Lectures.

Following the information regarding the above lectures on page 698 last week, we now have pleasure in calling our readers' attention to further particulars which will be of interest to those who contemplate attending the lectures. At Newcastle-on-Tyne the lectures will be held in the Armstrong College on Monday evenings at 7.30, commencing October 26th or November 2nd. In Leeds, in the Lecture Hall of the Yorkshire College, commencing Thursday, October 15th. In Manchester, at the Lecture Hall of the Manchester Geographical Society, afternoon and evening, commencing Friday, October 23rd, at 4 and 7.30 o'clock. Birmingham on Wednesday evenings, commencing October 14th. (The name of the hall and time will be announced next week.) Readers who contemplate attending these lectures are kindly asked to send their names without delay to the secretary, Lecture Dept., 20, Tudor Street, E.C. The fee for the course of eight lectures is £1 1s. Members of the Motor Union may obtain the tickets at a reduced charge of 12s. 6d., on application to the secretary, 1, Albemarle Street, W.

The M.C.C. Consumption Trial.

ON Saturday afternoon last the annual petrol consumption trial organised by the Motor Cycling Club was held on a circular course near Gerard's Cross, Buckinghamshire. The motor cycle section was extremely well supported, since there were twenty-five entries, of whom only three were non-starters. The method of measuring the consumption of fuel was as follows: To every machine Shell motor spirit was doled out to the amount of 1 pint for 300 lbs. total weight, increasing to $1\frac{1}{2}$ pints for 600 lbs., and to $2\frac{1}{4}$ pints for 1,200 lbs. in the passenger class, in which the only motor cycle representative was F. Cozens (10 h.p. Lagonda). Multi-cylinder motor bicycles were allowed 30% extra petrol. The machine covering the greatest distance on the allowance of spirit was declared to be the winner. The speed over the course was kept down to twenty miles an hour. According to the rules, "unjustifiable" pedalling was not permitted. Unfortunately, this led to some confusion, as there were not enough observers to watch the performances on the hills.

The Weighing Operations.

Each machine was weighed on a capital contrivance consisting of three iron legs supporting a long iron lever bearing a spring balance, while the latter had attached to it either a seat for the drivers or a pair of hooks for the motor bicycles as occasion required. Before the officials had got very far on with the weighing and filling a heavy rainstorm came on, which caused a good deal of delay, since for some time it stopped the proceedings altogether. At last the rain cleared off and the sun came out; but it was so late in the evening that the roads had not a chance to dry up, but, though wet and a trifle heavy, they were not greasy, and the surface was very fair. Following on the last motor cyclist to start, we made a tour of the course on a $3\frac{1}{2}$ h.p. Zenette kindly placed at our disposal by Zenith Motors, Ltd. The course (five miles in extent), which was practically circular, consisted of a stretch of the London to Oxford Road as far as the second turning to the right after leaving the Bull Hotel, Gerard's Cross, where the road descended gradually at first, and then became rapidly steeper into Fulmer village (an exceedingly pretty spot). Out of the village came a steep ascent, then a long straight stretch, a turn to the right, followed by a steep descent and a good hill immediately afterwards, a mile after which the Oxford Road was again reached. It will be gathered that this is not by any means a level course.

G. L. Fletcher, 2 h.p. Moto-Reve, who won the M.C.C. Consumption Trial on Saturday last. His performance was equal to 120.7 miles to the gallon. W. Smith, on a similar machine, was second.

Magneto Troubles caused by Wet.

The chief troubles experienced by the competitors were magneto troubles owing to the wet, and some failure to climb the hills without pedal assistance. The following members of the club started: V. Olsson (5 h.p. Vindec), covered three and two-third laps; Dr. C. Gibbons ($3\frac{1}{2}$ h.p. Deacon-Minerva), stopped on hill; W. A. Sale (5 h.p. Vindec), magneto trouble through wet; F. Mussell ($3\frac{1}{2}$ h.p. Quadrant), covered two and three-quarter laps; W. H. Wells (5 h.p. Vindec), wet on magneto; S. Webb ($3\frac{1}{2}$ h.p. Triumph), stopped on Fulmer Hill; B. C. Cumberland ($3\frac{1}{2}$ h.p. Triumph), had one stop; J. P. Le Grand ($2\frac{1}{2}$ h.p. Matchless), showed promise of a good performance, but dismounted on a hill; A. D. Draper ($3\frac{1}{2}$ h.p. J.A.P.-Matchless), puncture about one and a half miles from the main road; J. V. Robinson ($1\frac{1}{4}$ h.p. Moto-sacoche), left the course; W. A. Jacobs ($3\frac{1}{2}$ h.p. Rex), dismounted on a hill; A. W. Bentley ($3\frac{1}{2}$ h.p. Triumph), stopped top of Fulmer Hill; S. J. Seed (5 h.p. Vindec), dismounted on a hill; F. White (5 h.p. Rex), stopped half a mile from Fulmer; A. G. Fenn ($3\frac{3}{8}$ h.p. Rex), covered two and a quarter laps; H. C. Sayer ($3\frac{1}{2}$ h.p. Triumph), stopped at corner near main road, while W. Pratt ($3\frac{1}{2}$ h.p. P. and M.) did likewise; R. C. Davis ($5\frac{1}{2}$ h.p. Griffon), broke his belt on the last hill; S. G. Frost ($4\frac{1}{2}$ h.p. Minerva), reported to have pedalled on a hill.

The successful competitors were: 1, G. L. Fletcher (2 h.p. twin-cylinder Moto-Rêve), covered four and seven-eighth laps, petrol allowance 24 oz. 2 drams, about 120.7 miles to the gallon; 2, W. Smith (2 h.p.

The M.C.C. Consumption Trial. J. P. Le Grand ($2\frac{1}{2}$ h.p. Matchless-Jap) and W. A. Jacobs ($3\frac{1}{2}$ h.p. Rex), two of the competitors.

twin-cylinder Moto-Rêve), covered four and three-quarter laps, petrol allowance 22 oz. 2 drams, about 128.1 miles per gallon; 3, H. G. R. Slingo (6 h.p. Griffon), covered three seven-eighth laps, petrol allowance 31 oz. 3 drams, about seventy-five miles to the gallon.

According to the rules, pedalling, except when hampered by traffic, or stopping for any reason except for the exigencies of traffic, or the want of a clear course, led to disqualification.

The chief officials taking part in the organisation were: Messrs. F. J. Jenkins, E. B. Dickson, J. Van Hooydonk, H. G. R. Slingo, R. C. Davis, S. H. Fry, and R. H. Head.

The Motor Cycle Tourist Trophy Race.

Rail and Steamer Services to the Isle of Man.

The steam boats of the Isle of Man Steam Packet Co., Ltd., sail from Liverpool daily at 10.30 a.m. and 2.45 p.m. up to the 21st inst., and from Douglas: Tuesday, 22nd, to Friday, 25th, 9 a.m.; Saturday, 26th, 9 a.m. and 3.30 p.m.; Monday, 28th, 9 a.m. and 3.30 p.m.; Monday, 28th, 12.30 a.m. (Sunday night); Tuesday and Wednesday, 29th and 30th, 9.0 a.m. The fares are: First-class saloon return, six months, 10s.; first-class saloon, single, 6s.; third-class steerage, return, 6s.; third-class steerage, single, 3s. 6d.

The three riders who tied for first place in the Muratti Trophy Reliability Trials, Messrs. C. E. Murphy, J. J. Kennedy and J. Stewart. They all rode 3½ h.p. Triumphs. Our photograph was taken at the start of the ride to decide the winner on the 9th inst., but Messrs. Stewart and Murphy again finished with equal points.

Week-end tickets are issued on Fridays and Saturdays available to return on the following Monday or Tuesday, or four days' excursion tickets issued on Mondays available until the following Thursday: First-class saloon, return, 8s. 6d.; third-class steerage, return 5s. 6d.

Fast express services are run from London to Douglas in connection with the boats, leaving Euston at 10.30 a.m., and arriving at Liverpool (Lime Street) at 2.20 p.m. The afternoon boat is due in Douglas at about 6.30 p.m.

The rates for motor cycles are as follows: Motor bicycles accompanied with passengers, 2s. 6d. each; motor tricycles with more than one seat, 2s. per seat extra each.

The Rex Motor Mfg. Co., Ltd., Coventry, has notified the Auto Cycle Union that it is the company's intention to present a gold medal for the best performance by a private entrant on a Rex machine in the T.T. Race.

The Hotel Sefton, Harris Promenade, Douglas, Isle of Man, is to be the headquarters of the A.C.U. and the Dunlop Tyre Co. during the Isle of Man races. The hotel is situated facing the sea in a central position, and has an excellent motor garage attached to it.

For the information of competitors in the Motor Cycle T.T. Race who use Continental tyres, Mr. Harness, of the Continental Tyre and Rubber Co., Ltd., Manchester, will be in attendance at the Villiers Hotel, Douglas, I.O.M., where a large stock of motor cycle tyres of all sizes will be obtainable.

The T.T. Prize Fund.

Additional donations to the Auto Cycle Tourist Trophy Fund are as follows:

	£	s.	d.
W. H. Wells	1	1	0
Society of Motor Manufacturers and Traders	10	0	0
Robert Todd	5	0	0
Motor Press Agency	2	2	0
Manchester Motor Club	2	2	0
E. W. Brewerton	1	1	0
Stanley Show, Ltd.	26	5	0
J. H. Brereton	1	1	0
J. F. N. Templar	10	6	
F. S. Barnwell	2	2	0
S. F. W.	2	0	0
W. W. Powell	10	6	

The previous list will be found on page 710 of the foregoing issue.

The T.T. Shilling Fund.

In accordance with the announcement made in our last issue, we now have pleasure in publishing the names of the donors to the above fund, communicated to us by the Secretary of the A.C.U.: *The Motor Cycle* (100 shillings), E. Stanton (2), W. A. Mass, A.L., C.A.C., B.E.S. (2), R. S. Vinter (5), N. S. Vanhouse, G. A. Burnand, E. J. Jupe, R. H. Head, Dr. Gibbons, W. G. K. Barnes, R.N., Triumph, J.H.S., C. H. Butcher, F. Hansford, Dr. S. G. Longworth (5), A. D. Draper, H. Rem Fowler (5), Enthusiast, A. Grafton Sprague (5), Vanguard, H. G. Potts (5), D. V. L. Fellows, Two Limerick Motor Cyclists (2).

The Hull and East Riding A.C.C. Non-stop Run from Hull to London and back. A group of the five starters who left New Holland early on Saturday morning last. Their names and the machines they rode will be found in a paragraph on the next page.

CLUB NEWS.

Western District M.C. (London).

Members of the above club are reminded of the hill-climb which will take place on the 20th inst. Meet at Milford Hotel 9.30 a.m. sharp.

Bolton and District M.C.C.

The above club held a petrol consumption trial on Saturday, September 5th. The winners proved to be as follows: 1st, J. Fishwick (6 h.p. N.S.U.), winner of gold medal; 2nd, A. J. Moorhouse (3½ h.p. Triumph); 3rd, J. Mellor (3¼ h.p. Rex).

A Club for Ashton-under-Lyne.

A motor cycle club has been formed for the above district, with headquarters at the George and Dragon Hotel. The name of the club is the Ashton and District M.C., and the first meeting was held on the 9th inst., when nineteen members were enrolled. The subscription is 5s., with an entrance fee of 2s. 6d. Prospective members can have full particulars on application to the secretary, Mr. E. B. Brooks, 11, Dean Street, Ashton-under-Lyne.

Newcastle M.C.

The selling handicap competition held by this club on the 9th inst. would have been very successful if the weather had been more settled. The result was what the committee had aimed at, viz., to give machines which had been in use for some time a chance against newer models. A machine entered at £24 won the competition, receiving sixteen points start from the competitor next in merit. Results:

£24, G. S. Walker (3 h.p. F.D.W.), first prize; £40, J. Bates (3½ h.p. Dene), bronze medal for non-stop, finishing in schedule time; £40, Thos. Lee (4½ h.p. Frank tricar), special prize for best performance in passenger motor cycles.

M.C.U.I. (Ulster Centre).

On the 5th inst. a reliability run took place for prizes kindly presented by Mr. R. Graham Lindsay, over a course specially mapped out by himself, namely, Belfast to Newry *via* Lisburn, Lurgan, Portadown, Tandragee, and Poyntzpass, thence along Dublin Road to junction with road to Greenore (three miles from Dundalk), then to Bush Station and on through Carlingford and Omeath, back to Newry, thence through Banbridge and Dromore to Belfast; total distance 115 miles. The entries were: J. Stewart (3½ h.p. Triumph), R. Sharp (3½ h.p. N.S.U.), W. Wilson (2¾ h.p. Minerva), J. Holden (3 h.p. Rover), T. Greer (5 h.p. Rex), J. McAllen (3 h.p. Rover), J. Lavery (3 h.p. Triumph), W. J. Andrews (3½ h.p. Rex), J. S. B. McMurphy (3½ h.p. Triumph), J. J. O'Rawe (3½ h.p. Rex), and L. MacLaine (10 h.p. Lagonda tricar).

The first rider was due to reach the finishing point at 7.49 p.m., but it was 8.5 when Stewart arrived, his starting time being 2.6. Lavery followed immediately afterwards, having started at 2.9. Both these riders secured full marks at each control except at the finish, where Stewart lost 10 and Lavery 7. The latter was therefore declared the winner with a total of 43 points, Stewart being second with 40.

Great Yarmouth and District M.C.C.

On Thursday, the 10th inst., the club held a gymkhana in the Recreation Grounds. The event went off very well, but, unfortunately, the audience was small. Musical chairs and bobbing for apples were perhaps the popular events. The tortoise race, in which the competitors were started at the half-way mark, was won by the man who was last to arrive who kept his engine firing all the time.

Class A.—1 (or rather last), F. Worths (2¾ h.p. Anglian); 2, H. Collins (twin Sarolea); 3, A. H. Watts (3 h.p. Singer).

Class B (in which gears and clutches were allowed to be used).—1, F. G. Galley (2¾ h.p. Anglian); 2, F. W. Barnes (3½ h.p. Zenette); 3, — Hallinstein (3½ h.p. Wanderer).

Bending Race.—G. L. Fletcher (2 h.p. Moto-Rêve) was first, Dr. V. Blake (2½ h.p. Ariel) second, and F. C. North (4 h.p. Roc) third.

Saturday to Monday Race.—1, W. Smith (2 h.p. Moto-Rêve); 2, A. G. Reynolds (5 h.p. Vindec); 3, G. L. Fletcher.

The Musical Chairs Event.—1, Mr. Galley; 2, Mr. Scott (1¼ h.p. Motosacoche); 3, Mr. Watts.

The Academy Race.—1, Dr. Mayo (2 h.p. Moto-Rêve); 2, Mr. Smith (2 h.p. Moto-Rêve); 3, Mr. North (4 h.p. Roc).

In the rings and balloons event the riders had to catch a ring on a stick and burst a balloon. 1, Mr. Watts; 2, Mr. Galley; 3, Mr. North.

Egg and Spoon Race.—1, Dr. V. Blake; 2, Mr. Smith; 3, Mr. Barnes.

The last event was bobbing for apples. 1, Dr. V. Blake; 2, Mr. Barnes.

The Victor Ludorum medal, presented by the M.U., was won by Mr. Galley with eight points; and Dr. Blake second, with seven points.

Sutton Coldfield A.C.

Owing to objections raised at the last moment by the police it was found impossible to carry through the hill-climb which had been arranged to take place by the Sutton Coldfield Automobile Club at Gentleshaw on Saturday, September 5th. It has been arranged to hold the postponed competition on Saturday, September 26th, on a private road at Coalport, near Ironbridge, Salop.

Hull and East Riding A.C.C.

The outward journey of the Hull-London-Hull non-stop run resulted as follows: T. Wiles (3¾ h.p. N.S.U.), non-stop; C. Nicholson (3½ h.p. Rex), one stop; R. Pearson (3½ h.p. Minerva), one puncture; C. Harman (3½ h.p. Rex), one stop; R. Darnley (3½ h.p. Rex), retired at St. Neot's, magnet trouble.

A speed-judging trial will be held on Saturday next, the 19th inst. This will take place on the Hedon Road, Hull, at 3 p.m., starting from Marfleet.

Picnic to Kilnsea on the 20th inst. Meet opposite the Town Hall at 10.30 a.m.; proceed *via* Hedon, Patrington, and Easington, to Kilnsea Warren.

Southern M.C.

At the committee meeting held on Thursday last, the 10th inst., the following classes were decided on for the club hill-climb, which takes place on the 26th of this month: Class 3, passenger motor cycles, tricars, sidecars, and quad cars; Class 4, motor bicycles (twin-cylinder); and Class 5, motor bicycles (single-cylinder), A.C.U. formula. Gold medals will be given in each class to the winners. Members will receive entry forms in due course, and are requested to fill them up and return at once.

A slight error occurred in working out the times at the last monthly hill-climb, which gave the winner as E. K. Davies, T. E. Goodley 2, and W. J. Jones 3. This should read Goodley 1, Davies 2, Jones 3.

Nottingham and District M.C.C.

Thirteen competitors started in the first reliability run of the above club, commencing from the junction of the Melton and Loughborough roads, West Bridgford. The route was through Loughborough, Leicester, Market Harborough, Desborough, Rothwell, to Kettering; home *via* Rockingham, Uppingham, Oakham, Melton Mowbray, to Nottingham. The competitors were: G. H. Pearson (2¼ h.p. Bentinck), Hedley Castle (3½ h.p. Minerva), B. W. Maltby (4½ h.p. Minerva), Oswald Parker (3 h.p. Triumph), C. R. Smith (3½ h.p. C.C.R.), Robert W. Doughty (4 h.p. Roc), Harry Carnell (3½ h.p. Triumph), R. T. and E. L. Thornton (3¼ h.p. tricar), Claude H. Johnson (3½ h.p. Triumph), L. A. Nolan (3½ h.p. Triumph), and — Powell (2¾ h.p. Browne). The winner of the cup will be announced in due course.

SPEED TRIALS AT PORTMARNOCK.

ON Saturday afternoon last the Dublin and District M.C.C. held a race meeting on Portmarnock beach, when a programme of three events was decided. The afternoon was very favourable, and the sands were found in unexpectedly good condition after the storm in the earlier portion of the week. Two of the three events were won by R. H. Taaffe (3½ h.p. Triumph), and were it not that the handicaps were adjusted after each event he would probably have secured the three. The other race was won by N. J. Chambers (2¾ h.p. F.N.), the hon. sec. of the club. Mr. T. W. Murphy acted as starter and timekeeper.

In consequence of the Tourist Trophy Race being held on Tuesday next, the 22nd instant, "The Motor Cycle" will be published one day later next week, viz., Thursday, Sept. 24th, instead of Wednesday.

QUESTIONS & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Tyres with Sidecar Attachments.

?

(1.) I have a 4 h.p. Roc motor bicycle with Mills-Fulford sidecar, and should be much obliged by your usual sound advice as to whether you consider it would be better to fit some form of protection band on the rear tyre of the cycle (Clincher 26in. by 2½in.)? I understand that the wear on this tyre is heavy with any sidecar. (2.) Also do you recommend for spare tubes the butt-ended pattern or detachable ones with a continuous air current?—J.B.M.

(1.) An extra band on the back wheel of your machine would be desirable, as there is a much greater strain on the back tyre when a sidecar is used. It would be better to fit an extra heavy 2½in. tyre. (2.) Detachable tubes with a continuous air current are, we think, preferred by most riders.

Wear of Armature Bearings.

?

In the Simms-Bosch high tension magneto, if through loose or worn bearings, the armature in its revolutions scrapes against the pole shoes of the magnets, is there any weakening of the high tension current caused thereby with consequent misfiring at the plug? Now all the Melbourne experts whom I have asked about the matter agree that there is no weakening of the current by such scraping, and thus no effect is produced in the working engine, whilst they differ as to whether more rapid demagnetisation occurs or not. Now I claim to have absolutely proved in my own machine (F.N. four-cylinder) that such a fault in the magneto as I have described does very much weaken the current, and a friend of mine with a single-cylinder Peugeot (Bosch mag.) states he has proved it in his own machine also. Will you kindly give me the final opinion on the matter?—Dr. H. L., Victoria.

If the bearings are so much worn that the armature scrapes against the pole shoes, the strength of the magnets is considerably weakened, and this is a state of affairs which should be remedied without delay. This weakening is probably due to friction setting up a hard skin upon the surface of the iron which affects the magnetism seriously.

Overheating due to Alteration of Valves.

?

I have a 2½ h.p. F.N. which has run splendidly until a week or so ago. I took it to a garage to have valves ground in, etc., and since then it has run very poorly. I had a new exhaust valve and spring fitted. After running a few miles (about four) it overheats, the plug gets red hot, and the engine stops. I use as little gas and as much air as possible. Would a too weak or too strong valve (exhaust) spring cause this? It has nothing like the power and life it had. Everything seems in perfect order. I shall be glad to know if you could inform me of the source of the trouble.—U 369.

What has probably happened to your hitherto good running machine is this: The valve has been ground in causing the head of the valve to sink more deeply into the seating. This has increased the opening of the automatic inlet valve and weakened the spring. Or it may be that the new exhaust valve is not exactly the same length as the old one, and is either lifting too much or too little. If the stem is too long, you will have to soften the end of the valve stem, and file it down until there is 1-32in. clearance between the end of the valve stem and the tappet. It must then be hardened again. The tension of the exhaust spring would not be likely to cause the engine to overheat.

A Royal Roe Motor Cycle with Two-speed Gear and Montgomery Sidecar, owned and ridden by Mr. G. T. Willan, M.R.C.S., a medical practitioner of Sittingbourne, Kent, who informs us that he has used the sidecar almost daily for 3½ years. The extra child's seat is an idea gained from "The Motor Cycle" of a few years ago, and consists of a child's upholstered chair provided with footboard, and attached to underneath and sides of sidecar by bolts and wing nuts. Dr. Willan finds the motor cycle and passenger attachment cheaper and faster than a heavy single-cylinder car.

Various Interesting Queries.

?

(1.) Will a short wheelbase and also sitting well over the back wheel prevent sideslips? (2.) What sort of brake do you recommend for the back wheel—a wheel rim or a belt rim brake, and should it be applied by hand or through the pedals by back pedalling? (3.) Of the following, which do you think best to have control on the handle-bar instead of levers attached to the tank: (1) Exhaust lifter, (2) spark regulator, (3) throttle, (4) air? I have had several sideslips lately, and have been told it is owing to the long wheelbase and not sitting well over the back wheel.—F.W.

(1.) To prevent sideslip a medium wheelbase is required, and the rider should sit as nearly as possible midway between the back and front wheels. (2.) For the back wheel a brake acting on the belt pulley would be desirable, preferably controlled by means of a separate foot lever and within easy reach. (3.) We should recommend the spark to be adjusted by a lever on tank, and the exhaust, throttle, and air levers controlled from the handle-bars.

Queries respecting a New Mount.

?

I have a 1908 military model Roc machine, and should be glad if you will inform me on the following points: (1.) I find it somewhat difficult to start engine with handle from cold, even when petrol is injected in head. Should the magneto ignition be advanced fully before starting, or will this cause backfiring? (2.) Only one pedal brake is fitted. Can the low speed clutch pedal be used as a brake when the high speed is in without risk of injury to the gears? (3.) While travelling at high speeds on rough road the carburetter floods, and on one occasion caught fire. On examination I found that the petrol pipe is only $\frac{1}{4}$ in. away from magnets of magneto machine. Is it possible in such a case that the spark jumped from magnet to petrol pipe and caused the fire, and if so will the fitting of a magneto cover obviate the danger? I did not notice any misfiring on the occasion mentioned. (4.) There is apparently no means of lubricating the gears. Is this necessary, and if so, how can it be accomplished?—H.E.C.

(1.) Advance the magneto almost to its fullest extent, and if the machine still starts badly let us know and we can give you further advice. (2.) The engine can be used as a brake through the medium of the low speed gear, but when the high speed is in engagement the low speed is out of engagement. (3.) It would be advisable to have a tray underneath the carburetter to prevent the petrol dripping on to the magneto, though there should be no spark from the magneto at all at this point. The fire may have occurred owing to a backfire. (4.) The wheels are well packed with grease when gear is sent out if this has been used up, further out; if this has been used up, further rear wheel; when belt rim is detached the gears are exposed. There is a lubricator in the hub for oiling the axle.

Knocking and Loss of Power in Engine.

?

I have a $2\frac{3}{4}$ h.p. F.N. engine and carburetter, and just lately I have noticed a knocking sound which appears to come from the piston when being pushed over the top of the stroke. It seems to me that the gudgeon pin may be loose, but I have tightened up the set screws, and it makes no difference. There is also a loss of power which was remedied after reassembling engine, but after a short run it has disappeared. Can you account for this? Valves re-ground, new washer on plug, and apparently everything in order.—J.B.

The knocking sound doubtless comes from a worn gudgeon pin bearing or bush. The loss of power is probably due to slots in piston rings having got in line, which means taking the cylinder off to alter them.

Pre-ignition, Not Overheating.

?

Can you offer any reason for my $3\frac{1}{2}$ h.p. Minerva engine pre-igniting? The details are $3\frac{1}{2}$ h.p. 1906 Minerva engine, compression good, gear $4\frac{1}{2}$ to 1. The carburetter is a Minerva-Longuemare, No. 22 adapter, and eight slots in spray. The valves both lift about $\frac{1}{2}$ in., and the springs are nearly new. I purchased the machine second-hand,

J. C. Smyth, who will bestride a 5 h.p. Twin-cylinder Rex in Tuesday's T.T. Race.

and noticed afterwards that it has a 1907 cylinder, as there are slots cast in the radiator ribs for the two long bolts. I have tried the following without any improvement: Taken off cylinder and cleaned head of cylinder and piston. Tried different sparking plugs and different gaps in them. Tried different levels of petrol in spray chamber (raised and lowered it). Tried the engine without the adapter in carburetter. Engine will take all extra air when running very fast: in fact, it seems to pre-ignite worse with extra air open. The engine will not run slowly with spark retarded (accumulator ignition). I do not think it is overheating. Pre-ignition is so bad that after a short run I can switch off and run quite a long way on pre-ignition alone, without a misfire even. In other respects the engine runs very well, and will climb almost anything.—N.B., Westfield.

Examine the cylinder head carefully and see if there is any roughness of the casting which might cause pre-ignition. Provided the cylinder head and piston are clean, and that the compression is not too high, there should be no pre-ignition. You might try a steel washer about 1-16 in. thick between cylinder and crankcase, and so reduce compression a little. Do not omit to lengthen tappets or put caps on them 1-16 in. thick to make up the extra length. A smaller jet to the carburetter might also effect some improvement. The cylinder dimensions have not been altered since 1906.

Driving on the Exhaust Valve.

?

What harm can there be in lifting the exhaust valve at corners? When valve wanted grinding I was told I drove too much on the exhaust, and now I am told it is the right thing to do. If I knew the lifting or partial lifting of valve in moderation in traffic did no harm it would save me altering levers.—H.E.S.

The theory of driving on the exhaust valve is that the actual flame of the charge is in contact with the valve seating longer than is desirable, with the result that the valve gets badly burnt. The use of the exhaust valve in moderation is not harmful if the valve is entirely raised. This is the usual method of controlling speed in traffic.

Carbon Deposits and Amount of Oil.

?

I should like to have your opinion on the following: I have a 1907 $3\frac{1}{2}$ h.p. magneto Triumph motor cycle which runs perfectly, except that carbon deposit collects on piston top and top of cylinder very soon. The carbon deposit comes within a 100 miles after cleaning quite clean, which spoils the power at once. I use Price's Motormine A for lubricating, and give half charges about every eight or nine miles. Do you think a change of lubricating oil would remedy matters? What oil do you recommend for the Triumph engine?—J.O.J.

It would be rather interesting to get the carbon deposit analysed. Probably if you do this you will find that most of it is road dust. New piston rings should not allow the oil to get past them. You seem to be lubricating rather too freely, and we should recommend you to do this rather less often. The oil you are using is good, and we know of none better. Be careful to drive with as much air as possible.

READERS' REPLIES.

A Flooding Carburetter

I have had fitted to F.N. carburetter needle an adjustable collar carrying the two discs between which the toggles work. Formerly the discs were separately attached to the needle and soldered thereto. Now I can alter the position of needle as easily as is the case in the Longuemare by simply tapping with a very light hammer. The collar is, of course, a "driving fit" on needle.—J.S.W.

Mr. Lenette Rider.

At home—never thro' any fault of machine.

Reliability

and absence of vibration are the key-notes of the construction of the

'ZENETTE'

In designing, our aim has been to produce a machine luxuriously comfortable, durable, and which can be relied on to start easily, and to "get there" without unnecessary delay.

The result we are anxious to demonstrate, and shall be pleased to arrange a trial on receipt of request.

It should be borne in mind that the spring frame of the "Zenette" not only ensures absolute comfort in riding, but reduces the possibility of crystallisation. Every engineer and steel expert knows that excessive vibration will crystallise and finally break the finest steel, and many serious accidents have been caused through this alone.

Price 39 Gns. nett cash; or with Free-engine Clutch, 42 Gns.; or with the marvellous "Gradua" Gear, 50 Gns. nett. A few exchanges entertained.

ZENITH MOTORS, LTD., 101, Stroud Green Road, Finsbury Park.

P.S.—"Zenette" Spring frame Tricar-de-Luxe, 6-7 h.p. JAP engine, twin-cylinder, water cooled, 90 Guineas nett. "A little gem."

A NECESSITY When on Tour

The Autocar
FOLDING MAP for Motor Cyclists

(In Strong Case).

When on tour the motor cyclist is often faced with the question of which road to take or the best way to reach a certain place. All such difficulties can be overcome by carrying "The Autocar" Folding Map in your kit. It occupies very little space, as when folded it measures only 7½ in. × 9½ in. All main roads are marked in red, and the distances between all important towns are given.

PRICE 8/10, Carriage Paid.

Please mention that the folding map is required when ordering.

The Offices of "The Motor Cycle," 20, Tudor Street, London, E.C.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

BIG STOCKS NO CROCKS

AT THE PREMIER

No other firm can offer such a fine selection of new and second-hand machines as the Premier Motor Co. The second-hand ones are all carefully examined; no worn out or faulty machines are offered. All are covered by a Certificate of Fitness. The following are **SECOND-HAND or SOILED.**

SINGLE CYLINDERS.

TRIUMPH, magneto, 1907	£28 0
VINDEC SPECIAL, 1907	30 0
REX DE LUXE, 3½ h.p., 1908, two-speed, soiled only	38 0
WARWICK, 4 h.p., shop soiled, two-speed and clutch	33 0
N.S.U., 3½ h.p., spring forks, Roc clutch, two-speed	23 0
QUADRANT, 3½ h.p., 1906, very good order	13 0
N.S.U., 3 h.p., spring forks	15 0
BIRCHFIELD, 3 h.p. Spray, 1907	11 10
WHITLEY, 3½ h.p., spray, running well	8 0
EXCELSIOR, 2½ h.p., spray, splendid order	8 0
MINERVA, 2 h.p., M.O.V., spray, girder forks	6 10
UNIVERSAL, 1½ h.p., vertical engine, spray carburetter	3 5

LIGHTWEIGHTS.

F.N., 1½ h.p., 1907, magneto, spring forks ..	£21 0
F.N., 1½ h.p., 1907, ,, special silencer ..	21 0

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20 Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard this silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE

SECTION I.

Northumberland, Cumberland, Durham and Westmoreland.

1½ h.p. Minerva, running order; bargain; £5 10s.—Gardiner, Esklith House, Blyth.

2 h.p. Minerva, Palmer tyres, splendid running order; bargain, £8 10s.—J., 13 Croft Terrace, South Shields.

FOUR-CYLINDER F.N., magneto, spring forks, excellent condition, tyres nearly new, long bars; £19; trial near Stockton.—Box No. 762, The Motor Cycle Offices, Coventry.

3½ h.p. Rex, magneto, spring forks, 1908 model, good condition, with spare belt, tube, sparking plugs, etc.; a bargain; £15 10s.—J. H. Cockburn, 57, Durham Road, Blackhill.

1908 Lightweight Rex (new July), £20, perfect, bargain; 1905 Rex, thorough good machine, and in good order, only £4 or exchange light car.—T. Sill, Wood Turners, West Hartlepool.

4 h.p. Twin Werner, magneto, two-speed and free engine, spring forks, in splendid condition, £22; also 3½ h.p. Ormonde, Kelcom engine, £13 10s.—Lambert, glass and china dealer, 307, High Street West, Sunderland.

SECTION II.

York and Lancashire.

ROC, 4 h.p., magneto, free engine, single gear, brand new; £30.—Below.

N.S.U., 3½ h.p., magneto, spring forks, perfectly new; £35.—Below.

N.S.U., 5½ h.p., twin, magneto, free engine, 24 by 2½ tyres, condition as new, with Montgomery sidcar; £42.—Below.

TRIUMPH, 3 h.p., 1906, newly overhauled by makers; £18.—Hartley Oleg Motors, Burnley.

NEW 1908 Wolf, 2½ h.p., recently cost £33, accept £20; giving up.—19, Mountfield, Prestwich.

4 h.p. Magneto Antoine, fast, new condition; any trial; £22.—Lord, Mountfield, Prestwich.

4 h.p. Roc, with free engine, 1907, new Continental and Dermatine belt, also rigid sidecar; offers.—Mallison, Newland, Hull.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

MOTOR BICYCLES FOR SALE.

TRIUMPH, 3½ h.p., 1908, last two of contract; £48.—The Victoria Garage and Electrical Co., Ltd., Coventry.

TRIUMPH, 1908, four weeks delivered, only slightly soiled; £40.—The Victoria Garage and Electrical Co., Ltd., Coventry.

ZENITH Bicar, 3½ h.p., two speeds, chain drive; £25.—Below.

REX, 5½ h.p., twin, Roc clutch, two-speed; £28.—Below.

MINERVA, 3½ h.p., M.O.V., good condition; £14.—Below.

TRIUMPH, 1907, magneto, splendid order, 3½ h.p.; £30.—Below.

REX, 1905, 3½ h.p., good order; £10 10s.—Below.

NOBLE, 2½ h.p., very good condition; £11.—Below.

BUCHET, 2½ h.p., very low frame, going order; £9 10s.—The Victoria Garage and Electrical Co., Ltd., Coventry.

5 h.p. Twin Aleyon, spring forks and pillar, magneto, B. and B. handle-bar control; £22.—E. Turner, The Grove, Sutton Coldfield.

4 h.p. Minerva, girder forks, Longuemare carburetter, Palmer tyres, 26in. wheels; bargain, £12.—Gamble, 111, Humberstone Road, Leicester.

3½ h.p. Triumph, magneto, not ridden 32 many miles, new Continental tyre on back; best cash offer.—Carter, 139, Sneinton Boulevard, Nottingham.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

5 h.p. Twin Kerry, in running order, very fast; offers.—Dixon, Aylsham, Norfolk.

3½ h.p. Rex, Tourist Model, as new, 1908, not ridden 100 miles; too fast for owner; £25.—Apply, 90, Wenlock Street, Luton, Beds.

4½ h.p. Four-cylinder F.N., run about 600 miles, guaranteed perfect, spring forks, magneto; £27.—The Ashes, Stowmarket.

1½ h.p. Werner, Eadie frame, new Stanley-Dermatine belt, in good order; £5 10s.—E. Harnwell, Archdale Street, King's Lynn.

1908 3½ h.p. Quadrant, magneto, Clincher tyres, spring forks, low-built, latest model, absolutely new, never ridden, complete with Montgomery sidecar; £33, or separate, £26, quick sale; no offers.—Catton, 15, Out Risbygate, Bury St. Edmund's.

BRAND New 3½-4½ h.p. Peugeot-engined motor cycle, Vindec adjustable pulley, butted tubes, Clinchers, Gloria belt, very low built, finished in grey, and lined black, just been tested on the road, too powerful for owner; accept £22, or Rex lightweight and cash.—"Motor," 70, Mawson Road, Cambridge.

REX de Luxe, late 1907, 5½ h.p., twin-cylinder, Roc clutch, twin tyres, spring forks, cantilever seat, magneto, fitted with extra large luggage carrier, Lucas horn, watch, Premier searchlight lamp, separate generator, together with tools and spares, an ideal touring mount, in perfect running order; trial allowed; price £30.—Box 767, The Motor Cycle Offices, Coventry.

STANDARD Model, 4½ h.p. twin Minerva, Bosch magneto, Minerva spring forks, new studded tyre on back, Watawata, engine, magneto, and tyres guaranteed all sound, and condition good as new, a nice running machine, low built, fast climber, and one of the best on the road; for spot cash accept £22, or lightweight and cash.—Wallis, Grocer, Hills Road, Cambridge.

SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

4 h.p., Roc style, free engine clutch, two-speed, Duplex frame; cost 45 guineas last June, perfect order; sell £30.—No. 763, The Motor Cycle Offices, Coventry.

SPECIALLY Built 1908 Roc, 5 h.p. twin Peugeot, extra heavy all-speed gear and clutch, Druid spring forks, not ridden 150 miles, unscratched, packed in crate; £40 or complete with Fulford sidecar, £45.—Tyler, Pleasant View, Tylorstown.

MOTOR BICYCLES FOR SALE.

3½ h.p. Rex, spring forks, Longuemare, Continental tyres and belt, splendid order, winner of reliability run; £12. offers.—Ernest Cook, Foregate Street, Worcester.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, and Channel Islands.

23 h.p. Minerva, 1908, as new, not ridden 50 miles; £27 10s., or near offer.

3½ h.p. Quadrant, magneto ignition, 1907, hardly used, perfect condition, headlight, separate generator, bell, horn, Brooks spring seat, cut-outs; a bargain, £32 10s., or near offer.

2½ h.p. Excelsior, surface carburetter, Palmer back tyre, Clincher front, in good order; £8, or near offer.

4½ h.p. De Dion Car, seats four, in good running order, lamps, tyres in good condition, genuine bargain; sale or exchange, £30, or near offer.

5-6 h.p. Stirling Panhard, horizontal engine, dogcart body, three speeds and reverse, brand new gears, lately painted, tyres as new, wheel steering; sale or exchange, £25, or near offer.

8 h.p. Rover, 1907 type, seats four, splendid order, hood, screen, lamps; £170, or near offer.

13 h.p. Werner; £5.

THE above cycles are to be seen at W. J. Randall's Garage, 3, High Street, Andover.

LIGHTWEIGHT N.S.U., new, spring forks; 32 guineas.—N. Fairbank, Bulford Camp, Salisbury.

£5.—Hobart-Vaf, 1½ h.p., fair condition, tyres good.—C. Hodges, Lansdowne, Bournemouth.

FAIRY Motor Cycle, nearly new, not been ridden 150 miles.—Apply, W. Rossiter, 23, South Road, Kingswood, Bristol.

2½ h.p. Quadrant, spring forks, new Dermatine belt, splendid condition; £8 10s.—Hayes and Son, Pontywan, Mon.

5-6 h.p. Twin Kerry, long handle-bars, new tyres; sacrifice £18, or nearest offer.—James, Wotton-under-Edge, Gloucester.

TRIUMPH, 1908, cord Palmer and Clincher tyres accessories, condition as new; £38.—Pearson, Wickham Street, Portsmouth.

13 h.p. Minerva, less coil and accumulator, 14 Longuemare carburetter, good covers; £2 10s.—Harriss, Engineer, Ropley, Alresford, Hants.

3½ h.p. Minerva, 1908, spring forks, little used, perfect condition; £26, or near offer; any examination; Oxon.—Box 724, The Motor Cycle Offices, Coventry.

3½ h.p. Brown, 1905, holder reliability cup; 32 quick sale accept £11, bargain; bought twin; examination and trial by appointment.—Mathews, 6, St. Aldate's, Oxford.

3 h.p. Triumph, good condition, new studded non-skid, brass headlight and generator, stand, carrier; expert examination; bargain, £11.—J. Collings, 178, Shirley Road, Southampton.

3½ h.p. Triumph, 1907, magneto, condition as new, steel-studded non-skid and Peter-Union tyres, separate generator lamp, horn, spares; accept £29.—John Webber, Craufurdise, Maidenhead.

TRIUMPH, 1908, horn, lamp, generator, plugs, valves, butted tube, cyclometer, belt, magneto, spares, number plates, license, tools, spares, case, studded tyres; £35.—Hart, 41, Cambridge Road, Aldershot.

1906 3½ h.p. Rex, in good working order, spring forks, cut-out back tyre nearly new, a bargain £12; also 3 h.p. Stevens Chater-Lea No. 6 frame, in good order, £7, and decent push bike.—Heybourne Motors, Maidenhead.

1908 Wolf Motor Cycle, Stevens 1½ h.p. engine, Palmer tyres (unpunctured), stand, carrier, Bowden lift, B120 saddle, etc., not ridden 200 miles, perfect order; £15 or offer; trial.—Hatfield, Rectory Stables, Greatham, Hants.

MOTOR BICYCLES FOR SALE.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECOND-HAND and Surplus Stock.

2½ h.p. Fairy Motor Cycle, battery ignition, new, slightly shop-soiled, £23.

2½ h.p. Fairy Motor Cycle, battery ignition, second-hand, good condition, quantity of accessories; £16.

2½ h.p. Fairy Motor Cycle, battery ignition, second-hand, excellent condition; £14 14s.

TWO Douglas 2½ h.p. Motor Cycles, complete, new, only run 100 miles; £26 each.

Land's End to John-o'-Groat's.

London to Land's End and back.

London to Plymouth and back.

71 GOLD MEDALS.

British Made Beware of imitations.

Read testimonials from End to End riders:

"Woolwich, July 22nd, 1908.

"STANLEY DERMATINE MOTOR BELT CO.

"Dear Sir,—I write to inform you of the perfect satisfaction I obtained from your belt in the Land's End to John-o'-Groat's Trial. One belt only carried me from End to End, and to all appearance is in as perfect condition as new. Under the dreadful weather conditions experienced on this ride, it proves your belt, in my experience, a perfect production.

Yours faithfully,

"J. E. TASSELL."

"Birmingham.

"Dear Sir,—The belt behaved splendidly. I only had to take it up once during the trial (End to End), and it is still in grand condition. I had no trouble with it in the wet.

Yours faithfully,

"F. C. MUSTARD."

"Sheffield, July 24th, 1908.

"TO THE STANLEY WEBB CO.

"Gentlemen,—I used the belt you supplied me with in the End to End, and found it most satisfactory. I had no trouble whatever with it, and only had to take it up twice during the three days' heavy rain. I was not troubled in the slightest with it slipping.

Yours truly, F. DOVER."

"London, W.

"Dear Mr. Webb,—Thanks for sending me one of your new extra hook-fasteners to Warrington. I found it just the thing for Berridale. I simply slipped out the extra hook, and saved about ten minutes. Again thanking you,

I am, yours sincerely,

"GORDON GIBSON."

SPECIALITIES MANUFACTURING CO.,
23, Derby Road, WEST CROYDON.

MISCELLANEOUS.

TREMBLER Coil, 10s. 6d.; new gas lamp, 11s. 6d.—80, Palatine Road, Stoke Newington.

CHATER Pattern Frames made to order, £2 10s.; wheels, 17s. 6d. pair.—Munard, Belvedere.

TREMBLER Coil, 10s.; plain, 7s.; Bowden lever, 3s.—408, Lincoln Road, Peterborough.

GOODLAD'S Speedometer, new, up to 42 miles, flexible shaft.—J. A. Bell, W. low, Newark.

TORPEDO Tank, all fittings, oil and petrol, new; 12s. 6d.—Kendall, 235, Crystal Palace Road, S.E.

SALTER Typewriter (No. 7), latest model, quite new; cost £17 6s., unused, accept £14, a bargain.—F. Laycock, Springfield, Lancaster.

DUST Screens for tricars and sidecars, easily fitted; 27s. 6d., complete; photo of sole patentees.—Taylor's Motor Works, Edmonton.

26 IN. by 2½ in. Front Wheel, complete, with unpunctured cover and tube, spindle, etc.; 15s.—Percy Craven, 26, Ramsden Street, Huddersfield.

STANLEY-DESMATINE Belting, guaranteed new, two-piece belts, 3 in. 6s., 3 in. 7s., 3 in. 8s., 1 in. 9s.; carriage 5d.—Frank Whitaker, Green Street Green, Orpington.

MOTOR Cycle Frame, with tank, good as new, new tyres (which cost £3 3s.), M. and B. switch, everything but engine; £4.—Spence, Durham Road, Spennymoor.

SALE or exchange, Chater-Lea two-speed gear box, also clutch; wanted, pair 28 in. by 2½ in. tyres and tubes, pair forecar springs, and headlight.—110, Westfield Road, Wellingborough.

26 by 2 Clincher Cover and Bates band, 12s.; large silencer, new, 5s.; volt meter, 3s.; Lucas lamp bracket, 1s.; Lucas number plates, 1s.—Mitchell, 61, Earlswood Street, Greenwich.

SWAN-NECK Saddle - pillars, 2s.; long handle-bars, 4s., to own requirements; tanks, frames, etc., at cheap prices; trade work speciality.—Green Bros., 14, Avondale Road, Peckham, S.E.

BRAND New 4 in. Lens Mirror Searchlight Head Lamp, 9s. 6d.; also pair side ditto, 18s. 6d.; newspaper readable at 100 feet; approval willingly.—Sydney, 34, Bedford Square, London.

P. and R. 15 Amp. Accumulator, 6s.; Water-son plain coil (Quadrant), 6s.; both good condition, 11s. the two; Shamrock-Gloria 3 in. belt, 7ft. 9 in., worn, 2s. 9d.—Claypoole, 63, Queen's Square, Bristol.

NEARLY New Simms-Bosch Magneto, latest model, with cradle, two sprockets, and chain, ready to bolt on twin Minerva, guaranteed perfect, as new; the lot £4. — Wallis, Grocer, Hills Road, Cambridge.

GRIPWELL Motor Cycle Brakes, to fit any make machine, delivered from stock; price 15s. 6d.; any spare part supplied.—Sole manufacturer, W. Cocks, The Durham Motor Works, opposite station, South Ealing, W.

READERS having Photographic Apparatus for sale should advertise in "Photography and Focus" Emporium; ½d. per word, minimum 9d.—Address, "Photography and Focus" Offices, 20, Tudor Street, London, E.C.

GENUINE Chater-Lea front wheel, beaded, 26 by 2½, 7s. 6d.; 1905 Rex front brake, complete, 5s.; twin plain coil, wants repair, 5s. 6d.; Wright pattern footrests, fit down tube, 3s. 6d.—Wallis, Grocer, Hills Road, Cambridge.

3 h.p. water-cooled, £18; 3½ h.p. Bat, £12 10s.; 20 amp. Prested, new, 12s. 6d.; two belt rims, 3s. each; two tubes, 26 by 24, 5s. each; generator, 3s.; two saddles, 5s. each; oil pump, 3s.; wanted, 1 in. belt.—15, Reginald Road, Bexhill.

PARTS for 4 h.p. Antoine, piston and gudgeon, 6s.; three rings, new, 2s.; three used, 1s. 6d.; exhaust and inlet unions, 1s. 6d.; 2½ h.p. De Dion engine and silencer, perfect, except combustion head, £3 15s.; Longuemare carburetter, Model H., perfect, 15s.; two Clincher 700 by 65 covers with tubes, no cuts, 18s. 6d. each; 8ft. fish-back 3 in. belt, 4s. 6d.—Wm. Dobson, Penarth.

MISCELLANEOUS.

KONGO Rubber Belting, grooved; the last word in rubber belts, 3in., 9d.

KONGO Rubber Belting, cut to a correct angle, beautiful grip, never slips, 3in., 1s.

KONGO Rubber Belting is made of the finest materials procurable; 3in., 1s. 3d.

KONGO Rubber Belting is of the highest class, and price is popular; 1in., 1s. 6d.

KONGO Rubber Belting has a strong canvas core, surrounded by specially vulcanised rubber.

KONGO Rubber Belting.—3in., 9d.; 3in., 1s.; 3in., 1s. 3d.; 1in., 1s. 6d.

KONGO Rubber Belting can be had at Booth's Motor Exchange, Wade Street, Halifax, on approval.

BOOOTH.—Wide mudguards, with stays and screws; 3in., 2s. 11d.; 4in., 3s. 6d.

BOOOTH.—Double-twist horns, deep tone, 4s. 9d.; large leather toolbags, 5s. 6d.

BOOOTH.—500 Fuller's Midget plain coils, 10s. 6d.; 200 Fuller's Midget trembler coils, 17s. 6d.

BOOOTH takes your old coil in part payment; part with troublesome coils.

BOOOTH.—Fuller accumulators, 20 amp., 17s.; Rex type, 16s.; Minerva, 16s.; Midget, 16s.

BOOOTH.—5s. 6d. allowed for your old accumulator in part payment for Fuller's.

BOOOTH.—50 pairs XI'all spring forks; immediate delivery; N.A.B. seat-pillar, 3s. 6d.

BOOOTH.—Long motor cycle handle-bars, heavy gauge, best quality plating; 5s. 6d.

BOOOTH.—Silent silencers, for engines to 5 h.p., very efficient, no back pressure; 3s. 3d.

BOOOTH.—New Antoine frame, with wheels, belt rim fitted, two cable brakes, mudguards; £4 19s. set, low built.

BOOOTH.—Gas lamps, separate generators, powerful, light, well plated, 5s. 3d.; Mica plugs, 1s. 1d.

BOOOTH.—Pocket voltmeters, very handy and reliable, 4s. 1d., usually 10s. 6d.

BOOOTH.—Motor Frame, wheels, and tyres, suitable for 2 h.p. inclined engine; 40s.

BOOOTH.—200 best quality magneto covers, 2s. 3d. each, usually 5s. 6d.; new L.T. magneto, 20s.

BOOOTH'S Motor Exchange, Coronet Works, Wade Street, Halifax. Telephone, 198Y.

AUTOGENOUS Welding.—Send that broken casting to the Alvaston Motors, Derby, to be welded by patent process; metal reunited.

AUTOGENOUS Welding.—Costly castings saved from the scrap by our process. Cracked valve seats; water jackets, cylinder liners, pistons, frames, connecting rods, and a thousand other things.

AUTOGENOUS Welding. — Wonderful results. Broken flanges, lugs, brackets, etc., all amenable to our process; send part to-day; quotations on sight.

AUTOGENOUS Welding.—Alvaston Motors, Derby. Telephone, 1, Alvaston.

LUGGAGE Carriers of every description. —Send for particulars, Advance Motor Mfg. Co., Northampton.

ADVANCE Adjustable Pulleys to fit all makes. Thousands in use. Any gear in ten seconds without removing the belt; prompt delivery; price £1.—Address below.

HERE at Last!—An ideal adjustable belt fastener for variable pulleys; price 2s. 6d.—Address below.

ADVANCE Generator Brackets, as recommended by "Ixon," 3s. 6d. each.—Advance Motor Manufacturing Co., Ltd., Northampton.

CHATER-LEA-MATCHLESS inclined frame, girders, tanks, and pump, 30s.; De Dion coil, 7s. 6d.; stand-carrier, 2s.; Perfecta gas lamp, with bracket, wants door, 5s. — 483, Grove Green Road, Leytonstone.

NOTICE. BANDS!!!

(Our Speciality.)

Now is the time to have your cover fitted with a band of some description for winter riding. We strongly recommend both **Shamrock** and **Goodrich Rubber-studded Non-skid Bands** for this purpose. Our price for fitting either of these Bands to your own cover is 21/-. A non-skid and a double thickness tread is thus obtained.

Where a **Steel-studded Leather Non-skid Band** is preferred, we fit "Pulman," "Grose," "Brook," or "Shaw," according to choice.

When a Non-skid is fitted to the back wheel, a Non-slipping Band is advisable on the front. For this purpose an extra heavy "Bates" Fish-back Band is excellent, and we fit same to your own cover at an inclusive charge of 15/- (any size). This Band may also be fitted for back wheels with advantage. Other Bates Bands—heavy, 13/-; light, 11/6.

If buying a new cover, remember we allow 10/- for your old one in part payment, and are **Special Agents** for **Shamrock, Goodrich, Clincher Studded Non-skids, and Palmer Cords**. Remember what "The Motor Cycle" said of **Palmer Cords** in last week's issue. Delivery from stock.

Whatever your requirements, it will be to your advantage to write for our new "Illustrated Tyre List" (sent free). This gives particulars of our allowances, prices for all covers, and prices for retreading, fitting bands, etc.

SPECIAL TRADE LIST ON APPLICATION.

R.O.M. (Patent) Front Wheel Stand.

Price (to fit any machine), 14/6 per pair.

R. The only contact breaker Really suitable for twins with accumulators and coils. Ensures permanent synchronism.

O. R.O.M. means—more power, easier starting, smoother running. Illustrated list free.

M. For the convenience of our country clients wishing to purchase Second-hand Motor Cycles in or about London, we are at all times pleased to send one of our experts to examine same and give a detailed report as to condition, description, etc., at a nominal charge of 10/3. When the machine to be reported upon is situated at a greater distance than ten miles out of London, travelling expenses are charged in addition.

ALUMINIUM REPAIRS

MISCELLANEOUS.

MABON Clutch, little used, fit 1900 umph; 50s., or near offer.—Smar Garratt Lane, Earlsfield, S.W.

BROOKS Non-skid, 24 by 2 1/2, 25s., a bar Whittle belt, 7ft. 8in. by 3in., good condition, 12s.—A. Scorrer, 141, Coltman Street, Hull.

NO. 6 Chater-Lea Frame, with forks, guards, bars, engine lugs, etc. brand new; £3 17s. 6d.—Sallow, 50, Vau Bridge Road, S.W.

TORPEDO Petrol Tank, new, 5s., clips; four non-skid gaiters, brand never used, fit any size, lot 5s.—Cam, New Street, Worcester.

INSTANTA, the adjustable, detachable action belt fastener, for variable leys; price 1s. 6d.—Instanta, 251, Oxhill Handsworth, Birmingham.

TORPEDO Tanks, for oil and petrol, pump and fittings, 12s. 6d.; swan seat-pillars, 2s. 6d.; long handle-bars, pattern, 4s.; anything made to specification.—Arrow Motor Works, Victoria Peckham, S.E.

THREE-SPEED Free Engine Pulley, tive and reliable action, light, durable, no end thrust, guaranteed, s to fit; patent applied for.—New Non Motor Fittings, Ashtree Road, Starchley mingham.

SIDE Lamps, pair Powell and Ha best, plated, cost 50s., guaranteed tinguishable from new, accept 30s.; Longuemare carburetter, suit 6 h.p. offer accepted.—Brooke-Hitching, 74, Street, Liverpool.

PULLEYS for any motor.—De Dion, M 6s. 6d.; Antoine, N.S.U., Kelecom F.N., 5s. 9d.; Peugeot, Brown, 5s. 6d.; umph, Fafnir, Sarolea, Minerva, 4s. plated, guaranteed, carriage paid.—J. kins, High Road, Leyton, London.

CHATER No. 3 Frame, complete wheels, tyres, and tubes, £2 10s. by 2 1/2 wired Dunlop, 6s.; 24 by 2 1/2 Peter-U 6s.; plain coil, 5s.; Mabon free e clutch for belt drive, 30s.; 2 1/2 h.p. ex £2.—Stevens, 4, Goldhawk Mews, Sheph Bush.

PREPARE for Wet Weather. — Our brated motor cycling water jackets, in double paramatta, fitted wind cuffs, 14s. 9d., in blue, black, or f stock lengths, 36in., chest measurement 38, 40; extra heavy material, 18s. 6d.; alls, 7s. and 8s. 6d.; all carriage paid; cash with order.—The Impenetrable Clothing Co., 7, Brown Street, Prince's S Stockport.

HUMBER Tricar, 4 1/2 h.p., chain drive speeds, Continentals, water-co wheel steering, two coach-built seats, going order, £16; 2 h.p. De Dion engine feet, £2 5s.; Brooks B100 saddle, 8s. 6d. h.p. Chater frame Minerva, £4. — Ra bourne Motor Co., Southend Road, Ca S.E.

2 1/2 h.p. Alldays, in excellent condition spring frame Bat, less engine wheels, £4; Osborne four-speed gear, plate, £2; Mabon clutch, fit Peugeot, £ by 85 Michelin cover, £1; coach-built t front seat, £1; 3 1/2 h.p. water-cooled De engine, with coil, and Longuemare, £4 10s, Lark Lane, Liverpool.

FOUR-CYLINDER Magneto, Lacoste, running order, £3; 100 Fuller syn ignition coils, 16s. each; 150 Fuller L.M. accumulators, size 3in. by 3in. by 16 a.h., 10s. each; Dunlop outer cover, 8 90, grooved pattern, almost new, £3 odometer, hub cap pattern, suitable wheel 750-770, £1 10s.—The Fairy Motor Fairy Works, Blackheath. Telegr Frostbite, London. Telephone, 1021, ford.

FOR Sunshine and Showers.—The Al waterproof jackets, in double te paramatta, in fawn, also new grey-g wind and rainproof, stock lengths 36in. 40in., chest measures 36, 38, 40, and 42, storm cuffs, new collar, with attached We guarantee every jacket, price 15s.; heavy at 18s. 6d.; send length desired chest measure; overalls at 7s. 6d. an 6d. We pay carriage.—G. Raws and Indiarubber Manufacturers, The Alb Oldhall Street, Liverpool.

The Future of the Tricar.

THIS week our contributor Mr. B. H. Davies supplements our article in a recent issue on the popularity of the tricar by giving a specification of what he considers an ideal three-wheeler to carry two. On the whole we are quite in agreement with his specification, and he is doubtless correct in specifying chain transmission. It is, however, possible where cost is a consideration to get along quite well with a belt, provided its dimensions are sufficiently large and the belt itself is a flexible one. The only drawback to the belt is the inability to obtain a gear much below five to one without undue slipping at the engine pulley. True a large back belt rim can be employed, but this has certain disadvantages. With an engine of sufficient power to propel a 3 cwt. tricar geared five to one, an extra large belt has in our case proved quite satisfactory. If the engine is correctly made and designed both fan and water cooling can be dispensed with. Water cooling would doubtless enable the engine to pull longer on the high gear uphill, but the fan we consider quite superfluous. It must take some power to drive it, is troublesome to lubricate, and does not keep the engine much cooler.

Simplicity is the point to aim at, and consequently we think it advisable to advocate as simple a passenger machine as it is possible to make, *i.e.*, practically a motor bicycle with non-convertible forecar attachment. If the frame is sprung so much the better, provided it does not add materially to the cost of production, but in designing and making a motor cycle for two persons which shall be cheap to buy and cheap to run every little economy must be practised

which will reduce cost, provided, of course, it does not materially lessen the comfort of the passengers. Springing is a question of speed to some extent. If the speed does not exceed a maximum of twenty-five and an average of eighteen to nineteen miles an hour it is astonishing how easily and comfortably one is transported on a rigid framed tricar if the rear seat is amply large and the seat pillar suspended on a spring device which absorbs all shocks. The C springs of a forecarriage are, after all, as comfortable as those of a side carriage, and we hear no complaint of the absence of comfort in connection with the latter. The poor machinery has to suffer a few shocks, it is true, but with the exception of a possible tank joint fracture there is so little which vibration can affect on a modern machine that damage in this direction is negligible.

The T.T. Shilling Fund.

THE Auto Cycle Union is still open to receive donations to the above fund, and motor cyclists who feel disposed to assist the A.C.U. in awarding some cash prizes to the successful competitors in the Tourist Trophy Race, which was decided on Tuesday last, should forward a postal order for one shilling or twelve stamps to the secretary of the Auto Cycle Union, 18, Down Street, Piccadilly, W. The names of all the donors will be announced in our pages by arrangement with the secretary.

It may seem to some of our readers that with an entrance fee of five guineas per machine there should be no necessity to appeal for donations towards the prize fund, but the expense of organising and conducting a race in the Isle of Man is very heavy, and the A.C.U. is not by any means a wealthy body.

OCCASIONAL COMMENTS.

By "IXION."

The Best Sidecar.

I am a long-suffering individual, and allow my readers a pretty free hand in plaguing me with queries, but to all whom it may concern I hereby solemnly announce that I shall not in future take the faintest notice of any letter asking me which is the best sidecar, and if a stamp is enclosed I shall send it to the Home for Crippled Motor Cyclists. There is no best sidecar. The best sidecar I ever had was given me by a disgusted rider who said it could not be steered round corners—at least, not right side up.

Ignition for Lightweights.

Whatever opinions there may be about the best ignition for an ordinary motor bicycle, there can be no doubt that every lightweight must have a magneto. To begin with, maximum power is always required, and not every rider knows how to adjust a make and break to give the best results with a coil, whereas a magneto only needs adjustment once in a blue moon. Secondly, one is never safe on a prolonged tour either with a single accumulator (or dry cell) or even with two small ones; recharging may be inaccessible and spares not to be procured, while a lightweight is not adapted for carrying weighty spares. Hence the magneto must be standard upon all 80 lb. machines used for serious riding.

Why Not 3½ h.p. Twins?

I was riding the most delightful little machine the other day, and I began to wonder why so handy and efficient a mount does not figure largely in our regular makers' specification. It was a miniature V-twin, developing slightly over 3½ h.p. and scaling about 120 lbs. all on. It was a full roadster in every sense of the word, with spring forks, metal 4in. guards, Bosch magneto, 2¼in. tyres, 26in. wheels, large tanks, stand, carrier, etc., complete. It was easier to start than the modern high compression 3½ h.p. single-cylinder, ran quite as fast or as slowly as it does, and at no speed could the engine be "felt"—a statement I could not conscientiously make of sundry singles, while it was naturally a little smoother and more flexible than the best of them. I should like to see two or three of our big makers experimenting with such an engine, and believe it might presently attain a very considerable vogue. Of one thing I am certain. It would altogether knock on the head the demand for free engine clutches, which an all-round raising of compression ratios has resuscitated of late, for not even an 80 lb. lightweight could be more easily started than these handy miniature twins.

Footrests and Pedals.

I very warmly agree with the riders who advocate the retention of pedals even when footrests and a free engine are incorporated in a motor bicycle. We shall never invent a better or an easier method of starting a motor bicycle engine than the pedal and stand combination. It is free from danger, requires the minimum of effort, and is much more likely to succeed when the engine is stubborn than the best starting handle ever made. I have owned several machines fitted with handles on the engineshaft and destitute of pedals, and often when the engine refused to start on the handle at any price a short run along the road

would set it going, because the engine when so started was revolved faster than it was possible to do by hand. The defect of this method is that it is not a stationary method of starting, and if adjustments are in progress one has to return for one's tools, etc. In some cases it takes a lot of handle grinding to loosen a well-gummed piston, even after paraffin injections, whereas a few turns of the pedals generally does it quickly, and that without overheating the rider. Again, footrests are no substitute for a stand, except at momentary stops for other purposes than repair or adjustments.

Two-piece Valves.

A letter has reached the office from Mr. Broadhurst, of Leicester, who makes the cast-iron headed valves recently praised by Mr. G. Gray in our correspondence columns. He agrees with me that mere "shrinking"

A Roe military motor bicycle has been ordered by the Crown Agents for the Colonies for shipment to the Governor of Uganda—Entebbe. In consequence of the difficulty of obtaining supplies of petrol spirit, this machine has been ordered with a paraffin carburettor as shown above. Note the disposition of the vaporiser in the exhaust pipe.

of the hot iron head on to a cold steel stem would not be safe, and, incidentally, remarks that the shrinking is not the sole precaution taken in the manufacture of these particular valves, the extra security involving a trade secret which he is not at liberty to disclose.

A reader writes further advocating the construction of cast-iron headed valves by shrinking the heads on to the steel stems, instead of screw-threading and countersinking. He points out that the head may be shrunk hot on to a cold stem, and that as steel and cast-iron have different co-efficients of expansion, there is small chance of the heads coming off even if the valve is heated plum colour in the engine. The chance is undoubtedly small, if the job be properly done; all I wished to point out was that there is no special fetish of safety about the method, for I have had a valve of this type come adrift. Either method, combined with the best workmanship, is no doubt entirely safe. I don't think there will be any trouble with two-piece valves next year, as makers have now enjoyed the necessary experience and understand how strong these valves need to be.

The Flexible Pattern Sidecar.

AFTER four months' use of a Montgomery sidecar with compensating joints—during which time we have covered quite 800 miles—we are glad to be able to speak in high terms of praise for this attachment. Nor have we been able to use the sidecar under the best possible conditions, for our $3\frac{1}{2}$ h.p. Triumph is not equipped with a clutch or change-speed gear. Notwithstanding this apparent drawback we have been able to extract much pleasure from the combination, and the hills which this particular $3\frac{1}{2}$ h.p. bicycle will not take a sidecar up when geared about 5 to 1 are few and far between, in the Midlands at any rate.

Do we think the flexible pattern the best form of sidecar? No. There is no best. Each has its respective advantages, and, as we have said before, it is a question of personal taste. The reasons that the Montgomery sidecar appealed to us were:

(1.) Ease of attachment and detachment (less than one minute).

(2.) Storage difficulties less when separated from the machine.

(3.) Bicycle can be steered quite easily without a passenger in sidecar.

(4.) Steering with a passenger is almost the same as in the case of a bicycle, whereas with a rigid sidecar it is tricky, unless one is used to tricycle riding.

The great advantage of a fixed sidecar is its immunity from side-slip. On the other hand, it is questionable whether it is as safe to drive a fixed sidecar as fast as a flexible one on a dry road.

We have had one little mishap with the Montgomery sidecar, presumably due to the hook on the rear connection jumping up and lodging on the chain stay plate. Anyway, we suddenly found the whole combination making a dash for a ditch by the roadside, where the machine came to an abrupt stop—much too abrupt, in fact, to be comfortable. This happened near Bicester, Oxon, and, fortunately, the "passenger" was a Gladstone bag. In the *mêlée* the sidecar axle was

bent. Messrs. Layton and Son, of Bicester, straightened the axle, and also put a spring trigger on the hook of the rear connection to prevent it jumping off again. The sketch shows the device (which only cost 2s.), and it is worth fitting on all similar attachments. The latest patterns are sent out with a similar fitting.

When a sidecar attachment is used, naturally the wear on the bicycle rear tyre is much greater, and we should always advise tourists to carry a spare cover and

A Montgomery Sidecar Improvement.—Link A of the non-skid device has a tendency to jump off bridge D on a rough road. A spring trigger, C B, as sketch, prevents this possibility.

tube. A new $2\frac{1}{4}$ in. cover will usually be worn through in about 700 miles. $2\frac{1}{2}$ in. tyres would be the most satisfactory for passenger work.

Everyone who has tried the Montgomery sidecar has remarked upon its great comfort. Two little points which

might be improved, in our opinion, are: (1) The method of suspending the front portion of the attachment, which depends on a clip with a frictional grip around the frame tube to prevent the chair dropping to the ground; it is certainly good for adjusting the angle of the seat, but the consequences would be serious if the nut worked loose. (2) Mudguard stays are in the way when tyre repairing, and, moreover, break rather frequently. The mudguard, if made more like the wing of a car and attached in a similar manner to the body, would be sprung, far less liable to break, and would facilitate repairs to the sidecar tyre.

Other little conveniences would be: A compartment under the seat for carrying a spare belt and other tools; a bracket for a rear red light; and a leg attached to the sidecar axle to let down for supporting the wheel clear of the ground.

GERMAN MILITARY MOTOR CYCLISTS.

OVER 150 motor cycles were utilised in this year's German Imperial Manœuvres for orderly work, each cyclist receiving 30s. per day—15s. for the use of the machine and the remainder for expenses. They were attached to the divisions' staffs, and commanded by officers possessing either their own machines or equipped by the regiments to which they severally belonged. In general, intercourse between these civilians and officers left little to be desired in point of harmony, especially as the cyclists tried their hardest to please in carrying out orders; but not a few of the hidebound class of officers, who regard non-military persons as altogether inferior beings, have apparently taken far from kindly to the presence of civilians so deplorably deficient in military "form." However, unprejudiced officers also think that the volunteers would be all the better for a little military training. Lack of "form" apart, which is a cardinal defect in the eyes of the military, the volunteers tend to fail when required to deliver a verbal order, nor, owing to an inability to distinguish the different staffs and arms of the service, do they always succeed in

placing the message in the right hands. It is suggested that volunteers should go into strict military training a week or so before the manœuvres.

Respecting the more suitable class of machine, opinion seems to favour the lighter category. The heavy machines, though fast and reliable enough on good roads, often break down in rainy weather and over muddy field-ways, although some of the officers who ride light machines object to driving them over field-roads in wet weather. In course of time the Germans will doubtless bring man and machine up to practical military requirements. Meanwhile, defects notwithstanding, the motor cycle volunteers have rendered excellent service. Indeed, one might argue as much from the extra number engaged this year.

Brown Bros., Ltd., of Great Eastern Street, E.C., have just issued a new motor accessories catalogue, No. 30. This catalogue contains 184 illustrated pages of motor cycle and motor car accessories, with a convenient index alphabetically arranged. Each article is priced in clear figures.

QUESTIONS & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, **must be accompanied with a stamped addressed envelope for reply.**

Carbonaceous Deposits.

? What is the cause of my 1907 motor bicycle requiring the piston and cylinder head scraping every 250 miles? I inject a charge of oil every twenty-five miles on an average. The deposit is of a brick red shade. Naturally, it is a nuisance to have to dismount the cylinder so frequently. I studiously avoid a rich mixture, and always drive as economically as possible.—G.A.W.

It would appear that the piston rings of your engine are worn and allow the oil to pass. Try a new set. We cannot quite understand the brick red deposit unless it is due to the lubricating oil or petrol you are using. Always buy the best brands, and insist on being served from a sealed tin.

Ignition Items.

? (1.) I have a trembler coil, and the adjusting screw is under the bar holding the trembler blade and difficult to get at. I can't get the engine to run at high speed even on the stand; when the speed gets high it receives a check something like a misfire which keeps the speed down. Do you think the coil will be a slow speed one? (2.) As I am far from a charging station I would like to try dry cells, but my engine is old and has wipe contact, which would be expensive to alter, and as my mileage is only about 100 per month, do you think dry cells would do if I used a Voltco trembler coil, which I am told takes a very small current? (3.) The brass segment of my contact breaker disc is about one-fifth of the circle. Do you think the coil would work well if I reduced this? What is the smallest segment you would recommend? (4.) What gear should I have for a 75 by 82 mm. engine. 28in. wheels, weight twelve stones? —NEW READER.

(1.) The trouble may not be due to the coil. If the carburetter is not receiving sufficient air, or the contact maker requiring attention, the engine would fail to get up speed. We advise you to file the points of the trembler so that they are quite flat and clean. (2.) A Voltco coil would do, but if you use dry cells you should not use a trembler coil and wipe contact, as the latter are

too extravagant in current consumption. (3.) We should not think that the segment is too wide, but should strongly advise you to fit a make and break if possible. (4.) About $5\frac{1}{2}$ to 1.

For Ease in Starting.

? Would you kindly give me your advice on the following trouble: I have great difficulty in starting, engine 5 h.p. twin Peugeot, magneto Simms-Bosch gear driven, carburetter Brown and Barlow. I have lately had carburetter overhauled by makers. Also would you give me the best exhaust valve and ignition setting for the above engine?—J.C.H.

Thoroughly clean the platinum points of the magneto, set the sparking plug points as close together as possible without touching, set the magneto so that the points begin to separate with piston $\frac{1}{2}$ in. from the top of the compression stroke with the spark two-thirds advanced. The exhaust valve should close as the piston reaches the top of the exhaust stroke. If you fit a shutter to your carburetter, so that practically the whole of the fixed supply of air can be shut off, you will be able to start more easily.

Exhaust Valve Cap Red Hot.

? I have a $3\frac{1}{2}$ h.p. Rex which is running well under all conditions, but when riding in the dark the exhaust cap, and for half an inch all round the cap gets red hot. This, of course, I cannot see during the daytime. I cannot say there is any falling off in power at any time, and the machine is a splendid hill-climber, even after doing twenty miles quick run. I may state that I lubricate very freely, and use Vacuum B oil, and that there is no deposit on piston or top of cylinder. I have the correct carburetter adjustment, as I can give more air than engine will take, except when throttle is full open. Have I any cause for alarm?—EAST YORKS.

Generally speaking, the symptoms are due to an excessive amount of carbon deposit or driving with an incorrect mixture, but we should advise you to leave things as they are at present and carefully watch for further symptoms of the power falling off, and then take the engine down and clean it.

Change-speed Gear for Easy Starting.

? Two months ago I had a motor cycle built for sidecar work, 7-8 h.p. Peugeot engine, Bosch magneto, and all up-to-date fittings. The machine is a good one in every way and belt driven. My trouble is it is too hard to start with pedals. I am advised to have all sorts of speed gears and free engine clutches. Will you kindly give me your opinion?—J.C., York.

We advise you to have a two-speed gear fitted, and preferably one suitable for chain transmission, as an ordinary motor cycle belt is not so suitable as a chain for an engine of 7-8 h.p. With a change-speed gear you will be able to start with comparative ease by putting in the low gear and giving the machine a push. In fitting a two-speed it is inadvisable to have anything of the cheap variety, as it only proves expensive in the long run. Send us a list of gears, and we shall be pleased to place them in order of merit for you, taking your particular requirements into consideration.

The Correct Level of Petrol.

? I have a Model H Longuemare carburetter on my $3\frac{1}{2}$ h.p. 1906 Quadrant, and can only do about thirty-five miles per gallon. A few weeks ago the carburetter leaked and I ground in needle. Since then the petrol cost is very high. Being a novice I cannot quite understand the exact point that the petrol should reach when at its level, i.e., should it be at the top of the jet or at the top of the cone in which the jet screws? Also should the petrol run through the jet freely when machine is standing, or should the petrol just show in little beads through the holes? I use a No. 10 jet and choke tube No. 20, as used by previous owner.—S.H.C.

The petrol consumption is certainly excessive. The level of the petrol should come to within $\frac{1}{8}$ in. of the top of the orifice in which the jet screws. Test it with the machine standing on a flat surface with jet removed. The petrol should not appear at all unless the float is agitated, when it should shoot out through each of the slots of the jet. Try and see if the carburetter will take any more air.

Letters to

the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Footrests v. Pedals and Stands.

[3556.]—In reply to Mr. A. W. Wall and "Practical Experience," I have had trouble with the Roc clutch slipping. I sold a machine early this summer, and have had it returned innumerable times for this cause. The same has occurred with a conversion set fitted to another machine of different make.

The adjustment of the clutches will not make them grip properly when going up steep hills. Mr. Wall may say it is a matter of adjustment, but I do not think so, as all riders of machines fitted with the Roc gear that I have come across have the same tale to tell, and find only temporary relief in washing the clutches with petrol, and this requires doing very often.

A. HODGSON.

[3557.]—Mr. P. H. Langton's contribution is useful in dispelling the mischief frequently arising from merely oral or ocular fancy in contrast to fact based on experience.

Mr. Langton tells us from knowledge, not from hearsay, that handle starting is free from trouble, and footrests an improvement on bent or broken pedals. As regards his slipping clutch, the permanent cure is to be found in adjustment. There is no distinction between running in oil and splashing with oil to affect the slipping. Oil, not petrol, is recommended for the metal to metal bands.

On 1908 Roc machines, a regulating pin is provided on the outside of the belt drum to adjust the high gear to a nicety. Where adjustment is ineffectual the reason lies in errors of handling—a wheel, for instance, recently brought to the works for correction was found to contain the fulcrum of top speed band badly bent so as to make the regulating pin inoperative. The low gear, too, had been displaced from its proper position on the stay in a manner to upset the toggle movement, and, in consequence, the low speed band.

These hints may help your correspondent, whose letter, by the way, is welcome, if only to give the makers an opportunity to correct an ill-formed impression.

ARTHUR W. WALL.

[3558.]—I am very interested in the discussion in *The Motor Cycle* re pedals and pedalless gear, and should like to add my quota of experiences. I ride a Warwick with a Roc clutch and two-speed gear, which acts very satisfactorily when properly adjusted, and have never found the metal to metal clutches slipping as stated by one of your correspondents.

Despite this, were I to invest in another motor cycle I should get one with pedals, preferably with two speeds and a free engine, but certainly with pedals, and for the following reasons:

The handle starting method, though ideal in theory, is not so successful in practice. To support the machine and hold up the exhaust lifter with the left hand and to vigorously spin the engine round by means of the handle on the back wheel with the right hand is neither comfortable nor dignified, and should the engine be cold and stiff or recalcitrant, it is, single-handed, impossible, without liberal doses of petrol or paraffin in the compression tap. In fact, when starting in the morning I generally get someone to hold up the exhaust and support the machine whilst I "organ grind," and when the engine is revolving rapidly, tell him to drop the exhaust. I maintain this involves great labour and more gymnastics than starting a machine with a fixed gear.

When riding in traffic, the engine, if constantly declutched and made free, overheats terribly, owing to its racing, and, moreover, makes such a row that all in the neighbourhood cast black looks on the unfortunate rider. I consider it easier to raise the exhaust and pedal a little if necessary, and if one has to stop and dismount, two steps alongside and one is going again.

I have no stand on my machine, and have mended a good many punctures with the machine supported on one of the footrests, but I think a stand more convenient.

Finally, although I think the Roc clutch exceedingly ingenious and satisfactory, some other improvements are needed before it can be as perfect in practice as in theory. One is that the starting should be made more comfortable, such as by arranging an exhaust lifter somewhere under the saddle, but at present it is exceedingly awkward, especially with a long frame. The other is that there should be some method of throttling the engine automatically when the clutch is withdrawn, so that one could declutch and sit still with the engine running quietly as on a car.

MEDICO.

Standard Machines in Hill Climbs.

[3559.]—We have pleasure in replying to "Observer," who wrote in your issue of September 9th, and answering the queries he mentions:

1. The carburetter used at Newnham Hill-climb by Mr. G. Lee Evans was one which could be fitted to any standard Rex machine without extra charge. As a general rule Rex machines are fitted with the Amac or Longuemare carburetters, but any other make could be fitted on request.

2. The carburetter in question had no float chamber, but received its petrol through a valve which is operated mechanically in conjunction with the inlet valve tappet.

3. The machine used by Mr. Evans had identically the same bore as every $3\frac{1}{2}$ h.p. Rex machine has had for the past two years, and this will also be standard for 1909. The engine has been officially measured on previous occasions, and of course could be measured again.

4. Now with regard to the two $2\frac{3}{4}$ h.p. Rexes which ran in Class I. One of these was ridden by Mr. Barker, and had a 76 mm. bore and a 76 mm. stroke. This engine is five years old (early 1903), but surely there is no crime in a mount fitted with an engine of 1903 manufacture, as was the case in this event. Mr. Smythe's engine, which is 82 mm. by 70 mm., is the ordinary standard engine with 20 mm. taken from the stroke. Mr. Smythe, who is the owner of this motor bicycle, especially stipulated a short stroke, and no extra charge was made to him, or would be made to anyone else for such an alteration.

In reply to "An Also Ran," may we say that the Rex Co. will guarantee to supply him with a machine identical in every respect to the one ridden by the winner of the Bolton Motor Club's hill-climb, or any other hill-climb, at list price, and would very much appreciate his esteemed order.

THE REX MOTOR MFG. CO., LTD.

[3560.]—After reading several letters on the above subject I should like to make a few observations. First of all I must mention that I was a competitor at Newnham Hill-climb, and rode a 5 h.p. Rex machine (not Tourist Trophy model) fitted with all usual fittings—lamp, generator, large horn, $2\frac{1}{4}$ in. tyres, toolbag and tools weighing over 5 lbs. I am

not a "makers' tame amateur," and yet I was able to beat a good many more trade riders than I was beaten by, and as I do not consider myself a hill-climbing expert I was quite satisfied with the position I attained in the results.

Mr. Day in his letter specially mentions the scanty equipment of Mr. McMinnies's machine, and whilst I fully endorse his words I do not see why he was singled out. If Mr. Day had written the same of nearly all the T.T. Triumphs and some of the other machines as well, he would have been nearer the mark still.

"Looker On," I fancy, makes a mistake in mentioning the inferiority of an amateur's machine compared with that of a trade rider. It is the superiority of the tuning up and riding which makes the difference. What is the trade rider paid for?

I have only one little question to ask in regard to "Observer's" letter. Does a different pattern carburetter make an otherwise standard machine into a special? If so, a great many of us are riding special machines.

"An Also Ran" amuses me. I know the gentleman referred to in his letter (also his machine) quite well. If "Also Ran" will buy a similar machine to the one named at the list price (as I feel sure he can), it will be no guarantee that he will ever be anything else than his own *nom de plume*. It is the riding and tuning up that tells. It would have been better taste if Mr. "Also Ran" had signed his name.

Mr. Clarke in my opinion quite "fills the bill." If a representative of *The Motor Cycle* would ask competitors at the big hill-climbs what gear they are riding, I feel sure he would get correct information nineteen times out of twenty.

In conclusion, I should like to add that to my mind the Newnham Hill-climb was a splendid success in every way with the exception of two things—

(1) The spectators in their enthusiasm encroached on the road, especially near the finish, where one simply rode through a narrow lane of people and judged the available space by the way the crowd fell back.

(2) The officials were very lax indeed in seeing that their very complete rules were carried out. I wonder what the result on formula of Class 4 really was. A great number of riders in this class stripped their machines of all superfluities. I saw lamps, generators, toolbags, etc., put on the ground near the starting point, and yet the competitors were weighed, together with their machines with all on, before the competition started, and the results were calculated from the data thus obtained. This point might be carefully observed next time.

FRED C. BAGSHAW.

The Danger of Straying Cattle.

[3561.]—I am glad to notice that you draw attention to the danger of straying cattle on the road at night. May I relate my unfortunate experience, not with cattle, but so-called human beings, in my case a country farmer, who acted like a brute. Not long ago I had occasion to travel from Chester to Birkenhead. The night being dark, and the sides of the roads being lined with trees, I could only see a few yards ahead. A man supposed to be driving a farmer's cart was actually sleeping in the middle of the road without a light. Had I not been an experienced driver, and had I not good brakes, I should not have been here to write this. As it is, I was badly cut and bruised, and my motor cycle was a wreck. After extricating myself from beneath the trap, the farmer whipped his horse and drove off, leaving me stranded in the middle of the night eight miles from nowhere. Surely, something ought to be done to prevent such inhuman treatment.

N 363.

Is the Tricar Dead?

[3562.]—I was very pleased to read your remarks *re* tricars, as I think there must be a number of satisfied owners like myself of a light tricar. Of course, I am somewhat better off as regards refinements, being the possessor of a 4½ h.p. Riley, which, of course, is similar in every detail to the luxurious coach finished tricars, with the exception of being a bicycle frame. I may say that I am quite satisfied with this mount, and have had some extremely pleasant trips in company with my wife, and we have yet to meet the hill this excellent little machine will not negotiate with two up, and this (Colne) is a fairly hilly country I can assure you.

I am quite sure that, for the man of moderate means, the vehicle you specify in your remarks *re* tricars will give every satisfaction if only the price is kept to a reasonable figure. I might say that, previous to owning this my first and only

motor, I had no experience or mechanical knowledge of any sort, but up to the present have had no difficulty whatever. I may say I am an old cyclist of many years' experience, having ridden all kinds of bicycles from the old 54in. to safeties of every description.

C. WRIGHT.

[3563.]—I am interested in your correspondents' letters on the above subject, the more especially as I am a delighted tricar owner myself, and am of the opinion that, although probably the ultra-heavy type of tricar, such as the 8 h.p., 10 h.p., and 12 h.p. twins, will fall out of the running in course of time, there will always be a good demand for a light, low-powered machine, if it is sufficiently brought before the notice of the public, and is equipped with a satisfactory change speed gear. To my mind, my present mount, though far from perfect, is of a type which would appeal to hundreds if they were aware of its capabilities. The following is the specification: Frame, Perry's fittings; hubs, Perry; engine, 4 h.p. W. and P. water-cooled single-cylinder; gears, three-speed Oppermann (5, 9, and 15 to 1, and free-engine); transmission, Renold's 5/16in. pitch, 1/4in. roller chains; seats, coach built aluminium. leatherette upholstery; brakes, powerful rear-driving (pedal) and Bowden front (side lever); control, wheel steering and thumb slide control; tyres, 26 × 2½ rear and 26 × 2½ front wheels.

To this machine I have added a specially made rear luggage carrier, a comfortable enclosed footboard platform for driver's feet, with tool box one side of engine and accumulators and coil in box the other side to match. The horn is operated by small electric push button under steering wheel rim, and is thus always by my finger. The rear lamp is electric, and two Autoclipse lamps complete the equipment. I should mention that the room at my disposal under the front seat has been trebled by myself, and all the larger spares, jack, inner tubes, tin of grease, carbide, spare chains, etc., are easily stowed therein. The weight of the car, ready for the road, cannot be far short of 4½ cwt., and with two passengers weighing 22 stones, easily exceeds thirty miles per hour, and on top gear will do most surprising work. The machine is most comfortable on good roads, but the frame itself should be sprung fore and aft to ensure comfort on bad roads; it is at present only sprung as regards the seats.

P. H. MEERS.

[3564.]—We welcome the letter appearing in your columns from "Old Hand," commenting upon the large number of tricars which he had seen during his recent tour. Your leader on this matter is also interesting to us as the introducers of the tricar and as a company doing a large business in the type.

The question is asked, "Is the tricar dead?" and we have no hesitation whatever in stating that it is dead in the abnormally powered and heavy form, which was so much the craze a couple of years ago, and whatever feeling has been engendered against the type, we are absolutely certain has been the result of these huge machines, which have been little more than motor cars on three wheels. As you are aware, we have always set our face against this type of tricar, and have maintained the Phoenix Trimo within the limits of its type (and every type of motor has its limits), and the result is that our 5-6 h.p. water-cooled Trimo, weighing a matter of 4½ cwt., with comfortable seating accommodation and simple mechanism, finds a ready sale, and, so far as we are concerned, the tricar is very much alive.

We would take this opportunity of referring to a point in which the tricar as a general type has not had a fair show, and that is that almost without exception the competitions which have been promoted for three-wheel machines have given the palm to the fastest time only, irrespective of horse-power, and it is for that reason that the Phoenix Trimo has not figured during this year to any extent in open hill-climbing competitions. It is not a bit of use our entering our machine to compete on level terms against machines of double the horse-power when the result is judged on time alone, and we are sure that a great deal can be done to bring the tricar back not only to its original position of popularity, but to an enhanced popularity if the hill-climbing competitions were, for this type of machine, to be divided into classes so that certain horse-powers could compete together.

Not only the trade, but private owners as well, are chary of going in for a competition in which all the powers compete together, and the result of which is a foregone conclusion.

PHOENIX MOTORS, LTD.

Western Country Roads.

[3565.]-In "Current Chat," September 9th, I see a rider congratulates himself on saving his tyres by avoiding the roads over Salisbury Plain *via* Amesbury, stated to have been cut up by the military operations. This last week-end I rode through Andover, Amesbury, Shrewton, and Salisbury, and found the roads perfect. GEO. GRIBBON.

Hill-climbing.

[3566.]-Having lately seen in your columns an account of several hills which have been described as much more formidable than the famous Yorkshire hill, Sutton Bank, I recently managed a run to the Minehead district with my friend, Mr. I. B. Hart-Davies, a well-known rider, whose weight is close on 14 stones. Both mounted on Triumph machines of standard touring pattern, we left Coventry after lunch on Friday, 11th inst., and reached Minehead at 1 p.m. on Saturday, having slept at Clifton, and encountered some lovely grease *en route*. We arrived at our destination without incident, bar performing some extra risky wobbles. My friend, as a sort of preliminary canter, had a dash up Porlock Hill. He took the first acute bend in remarkably clever fashion, but found the second bend absolutely unrideable owing to thick grease.

We then went on to Lynmouth Hill, which the aforesaid rider went up in irreproachable style, making me green with envy in the attempt. When at this ascent we were advised to have a shy at a pimple variously called Riddiway Hill or "The Beggar's Roost." The latter appellation could not be more suitable, as I fancy many an ambitious mountaineer will roost thereon at various altitudes more or less exalted, chiefly the latter! Much to my astonishment Mr. Hart-Davies succeeded at his second attempt in conquering this truly appalling hill, notwithstanding the wretched surface, and the fact that his trusty mount had not been touched after a fast ride down of over 150 miles.

Mr. J. Hardman, the schoolmaster at Barbrook, assured us that Barbrook Hill was absolutely verdant soil for cars and bicycles of all descriptions.

I understand an official survey of the hill is being prepared for the Motor Union. Needless to say, I shall await the correct card" as regards the gradients with keenest anticipation. (Dr.) JAS. C. O'RAFFERTY.

The Lightweight Question.

[3567.]-With reference to the recent articles and letters that have appeared dealing with the lightweight machine, I would like to add my experience, namely, that I have ridden Motosacoche for over 4,000 miles on our Irish roads (which are none too good). The original tyre is still on the front wheel, and, as far as I can remember, has been only punctured once. The original back tyre got badly torn and was replaced with a Palmer, which has now done about 3,000 miles, and has been punctured four or five times, but otherwise it appears as good as ever. I have used the same belt since last spring, amounting to about 3,000 miles riding, and it seems to be quite good yet. I join the belt by means of belt-cing wire; it makes a much better joint than the hook, as neither breaks nor pulls out. I had trouble with the steel rims getting battered by stones, which rendered the front brake unsatisfactory. I therefore fitted a back-peddalling master hub brake, which is a great improvement, as even if the rims are battered it does not affect the smooth braking of the machine. I have never had a loose spoke. The speed and hill-climbing capabilities of the machine are all that any ordinary person can want. I have constantly ridden to a town twenty-two and a half miles from home over hilly roads, of which some parts have a very bad surface, in 55m., and required no pedal assistance on the journey.

I will make no remarks on the engine, etc., as everyone seems to admit that this is almost perfect. The only vice I could give would be to fit a band or hub brake instead of rim brake.

SATISFIED.

[3568.]-Having become very interested in the lightweight controversy going on in your columns recently, I would like, if you have available space, to make a few remarks on my own experience. But let me begin by saying that "Ixion" could not have hit the nail on the head with more exactness than he did when replying in the issue of September 9th to Messrs. Dufaux's rejoinder to his previous letter. Indeed, my own experience, briefly put, would be to say that I endorse every word of what "Ixion" says.

I bought a Motosacoche just a year ago, having found out quickly that the "heavyweight" is not the machine for a doctor who has to stop and start frequently. Well, to begin with, my belt troubles were innumerable till I persuaded the makers that they had given me a bad belt which was everlastingly tearing through every few miles.

Last Easter the engine and attachment were fitted to a new Rover frame. I had the machine taken to pieces recently for some improvement, and have examined every detail of it personally. I found amongst other things my front wheel axle bent equally on both sides, showing, I think, that it is not strong enough to bear the weight. My accumulator case has given way, and I have had it reconstructed, and yet I take every possible care of my machine and do not average more than ten to fifteen miles per diem, and have not ridden it 2,000 miles.

The engine I have had down more than once, and no one would deny its excellence. I spoke above of improvements. One is this, I have had a 4in. pulley fitted instead of a 3in., and am now running direct drive, having dispensed with the jockey pulley—a thing the makers told me would never succeed. The machine is running better than ever on the high gear, and takes hills really just as well as before, which is quite odd, is it not, in face of the above assertion.

F. J. GEOGHEGAN, M.D.

[3569.]-We have just received two favourable letters from Motosacoche riders relative to the behaviour of their tyres and rims. Our experience of tyres, belts, and rims on the Motosacoche is that they are in every way suitable and efficient for the lightweight bicycle. If they are not you may take it for granted we should know all about it, since customers are not as a rule both dissatisfied and dumb. As a matter of fact, we are quite astonished to learn from "Ixion" that the tyres and rims of the Motosacoche bicycle are unsuitable, and our wonder is that hundreds of Motosacoche riders have not said so.

It is remarkable that there are riders who forget all about their push bicycling when they take to motor cycling.

The push bicyclist requires his cycle as light as possible; every fitment is cut down to the finest proportions—lamps, bells, tools, inflators, and even repair outfits are featherweight. Yet give him a little engine in the framework and immediately his featherweight notions go by the board. Quite recently we came across a Motosacoche bicycle which was fitted up in a manner quite out of keeping with the original proposition of a lightweight motor cycle. The horn and lamp were more suitable for a car. Two luggage carriers and a heavy cycle stand, with a two gallon tin of petrol strapped on, plus a big camera, big tool-bag, a handbag, and a carry-all of clothing.

This is the sort of thing which we deprecate most strongly. The Motosacoche is not designed or built for such an equipment, any more than a light skiff is intended to do the work of a barge. It is a lightweight motor bicycle, all its parts are built in exact proportion, and if it is used as a lightweight it is simple, efficient, durable, clean, easily handled, capable of fair speed, and a good hill-climber. More we do not claim for it.

H. AND A. DUFAUX (ENGLAND), LTD.

The line sketch published last week to illustrate a letter signed "No Noise," under the heading of "Silence," page 724, should have had the exhaust pipe shown on the left-hand side of the silencer, and not on the right. The fact that the exhaust gas has to strike against the small diameter tubes in the silencer before it is allowed to pass through them and into the atmosphere, causes the gas to be more broken up than if it entered on the right.

EXPERIENCES WANTED.

"A.J.G.R." is anxious for readers' experiences of Hellesen dry cells, and the name of coil and contact breaker used.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

CURRENT CHAT.

SPECIAL FEATURES.

THE TOURIST TROPHY RACE. SPECIAL DESCRIPTION.

HAS THE TRICAR A FUTURE?

TIME TO LIGHT LAMPS.—Sept. 23rd, 6-58 p.m. ; Sept. 26th, 6-51 p.m. ; Sept. 30th, 6-42 p.m.

To Make Motor Cycles.

In addition to Humber, Ltd., it is rumoured that two well-known Coventry firms of cycle manufacturers will make motor cycles next year.

Affiliation.

The body most recently affiliated to the A.C.U. is the North Eastern Automobile Association, Motor Cycle Section, which boasts of 150 members.

Motor Cycle Insurance.

The A.C.U. has arranged with the Car and General Insurance Company to issue special A.C.U. policies to all members at a premium of 10s. 6d., which will cover riders of any make of motor bicycle up to 5 h.p. to the amount of £50 for third party risks, and up to £20 for damage by fire, explosion, self-ignition, etc.

A.C.U. Winter Session.

The Rev. B. H. Davies, whose papers are always interesting, has kindly offered to read a paper on the "History and Future of the Tricar" before the members of the A.C.U. during the winter months.

Audible Warning.

Riders of motor cycles in the neighbourhood of Corfe Castle, Dorsetshire, should not fail to treat the inhabitants to as much horn blowing as possible, for a very considerate Rickmansworth rider who visited the locality during his summer vacation has, to his surprise, received a summons for not giving audible warning, although he was riding with the cut-out open. No complaint was made at the time, neither does the rider remember meeting anyone who was startled by his approach. No danger is alleged in the summons. The case will be heard to-morrow.

The 1908-9 Stanley Show.

The invitation smoking concert which is given by the Stanley Cycling Club just previous to the Stanley Show will be held again this year at the Queen's Hall, Langham Place, on Friday, November 6th. We understand that an excellent programme has been arranged, and tickets can be obtained of the hon. secretary, Mr. E. P. Hewkin, 106, Tollington Park, N.

The thirty-third annual dinner of the Stanley Cycling Club will be held on Saturday, November 14th, at the Whitehall Rooms, Hotel Metropole, S.W., under the chairmanship of Mr. Robert Todd, president of the club.

A.A. New Premises.

The Automobile Association Road Department has grown so much of late that it has been found advisable to transfer this department to 8, New Coventry Street. All communications referring to patrols, applications for agencies, positions, etc., should be sent to that address.

Electrical Cycles.

A reader named Mr. V. C. Double-day informs us that towards the latter end of 1892 he formed a small syndicate for the purpose of experimenting with electrically-propelled tricycles, and has just come across a cutting from *The Financial News* of that time which now (sixteen years afterwards) affords rather amusing reading. The

Mr. C. H. Stephenson, in sending us the above photograph from Bergen, says: "How is this for hill-climbing? Have never seen a motor cycle in Norway, but I long for my Vindec. Roads are good but narrow."

article is headed "Electrical Cycles," and among other paragraphs more humorous than the rest may be mentioned, "The existing cyclist is the terror of the thoroughfares. If electric cycles are to supplement the existing hazards of the road, life will only be tolerable on some pathless moor or on the rugged boulders of a rocky coast.

To be knocked down and run over by an athletic cyclist is bad enough. To be knocked down and run over by an indolent person, who lets the batter do all the work, would be the very depth of humiliation. Harley Street would be shocked out of its propriety if by any chance some daring disciple of Æsculapius ventured to go his rounds on the new vehicle, etc., etc. Hundreds of the aforementioned disciples now go their rounds on motor cycles, and Harley Street has not lowered all its blinds to hide the shock received to its propriety.

The T.T. Shilling Fund.

A reader of *The Motor Cycle* in sending a shilling towards the shilling fund for the Motor Cycle Tourist Trophy Race says he is not as yet the lucky possessor of a motor cycle, but he takes a great interest in motor cycling and reads *The Motor Cycle* every week.

A Coincidence.

It is a strange fact that one of our most celebrated firms of car manufacturers has for next year altered the shape of the top of the pistons from flat to concave, whereas a noted firm of motor cycle manufacturers has recently decided that a piston with a convex top is an improvement over the flat-topped piston, and will use such during 1909.

Police Traps.

One between Trumpington and Cambridge bridge. Another extending from the foot of the Gog Magog Hills, along the Hills Road towards Cambridge. The last-named is worked mainly during the week-ends throughout the University terms.

There is a measured quarter-mile between Milford and Godalming, on main Portsmouth Road.

Between Saltash and St. Mellion, on the Plymouth-Launceston Road.

A Motor-propelled Canoe.

A well-known Oxford motor cyclist and a contributor to *The Motor Cycle* Mr. O. L. Bickford, has made himself a steam canoe of small dimensions. He first of all tried a 1½ h.p. motor bicycle petrol engine, 2in. bore by 2¼in. stroke, air-cooled, but the vibration of the engine made the seams of the canoe leak, besides, it had a habit of catching fire. He finally adopted a small steam engine, a description of which was recently published in the *Mode Engineer and Electrician*.

.. THE ..

LEATHER WATAWATA

is the greatest of power
economisers, and possesses
most wonderful tenacity and
durability.

WHICH WATAWATA ?

Whether you be in favour of a composition belt or a leather one, you cannot do better than choose a Watawata. Durability, strength of grip, and wastage prevention, are features of both belts owing to the scientific lines on which they are constructed. Another point about the modern Watawata, is the hook fastener which permits of quick and easy shortening.

Write for List, Dept. B,

O. & W. ORMEROD, LD., ROCHDALE.

Watawata

Belts in Rubber or Leather are the most efficient made.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

A MYSTERIOUS DISEASE & MOTORING NERVOUS EXHAUSTION.

The Strain on the Brain and Nerve-centres causes the Exhaustion of Neurasthenia.

A Scientific Method of Brain-feeding and
gratulations of His Holiness the Pope's

Strengthening earns the con-
Physician-in-Ordinary.

The heavy sleep engendered by motoring, especially driving, is now known to be caused by a form of exhaustion of the brain and nerve centres. The muscles do not tire anything like the extent that the brain and nerve cells do.

As showing the capacity of the muscles alone to resist fatigue, take the case of Burgess, the swimmer. After his recent record swim of twice round the clock in the English Channel, he climbed up the side of the accompanying tug, and within two or three minutes of lying down was sound asleep.

Now, the wear and tear upon the nerve centres of brain and nervous system of the driving of a motor are far more exhausting than in swimming. In the latter there is not the intense mental application demanded in driving a motor, especially a fast one.

Many accidents, trivial and serious, occur owing to lack of concentration, which means that the brain centres governing the mental functions of seeing, calculating, willing and directing of the hands that grip the steering wheel have either temporarily or permanently lost their power to act in unison.

The man or woman conscious of any of the following symptoms of the exhaustion of neurasthenia, so prevalent to-day among city residents and brain workers, and who takes up motoring as a health measure, is attempting the dangerous.

Sensitiveness			
Restlessness		Irritability	
Melancholia	Nervousness		Pessimism
Hysteria	Fearfulness	Inaptitude for Steady Work	Dizziness
Memory Weakness	Weak Will Power		Lack of Mental Clarity
Brain Fag		Insomnia	
Mental Derangement			
Suicidal Tendency			

What the reader conscious of any of the foregoing symptoms needs is to **feed**—and thus **strengthen**—the depleted nerve cells of his brain and nervous system.

Happily, a discovery of vital importance in the treatment of neurasthenia has recently been made by a distinguished German medical scientist—Dr. Carl Hartmann. So important, in fact, was this discovery in the domain of medicine that His Holiness the Pope's Physician-in-Ordinary wrote warmly congratulating Dr. Hartmann upon his achievement.

His letter is as follows:

Rome.
Dear Sir,—I made trial in my private practice of "Antineurasthin," and shall prescribe it henceforward, as it is an admirable agent for toning and strengthening the nervous system. I take the liberty of congratulating you on your discovery.

(Signed) DR. GUISEPPE LAPPONI
(Physician-in-Ordinary to
His Holiness Pope Pius X.)

That this high praise is not in the slightest degree unmerited is proved by the experiences of English men and women who have put Dr. Hartmann's discovery of a method of true physiological brain and nerve nutrition to the test.

Dr. Hartmann's "Antineurasthin" brain and nerve food feeds and strengthens the whole nervous system by first strengthening the weakest brain centres, whether they govern the optic nerve, or any other individual nerve, or group of nerve cells.

Hundreds of personal "experiences" can be seen at the London address for the supply of Dr. Hartmann's nerve food. It is most evident that there is a great—and ever-increasing—amount of neurasthenia in this country, and it is hoped that those who are conscious of one or more of the symptoms quoted in the "pedigree chart" of neurasthenia will not neglect to make a free trial of the antidote now available through Dr. Hartmann's nerve-feeding "Antineurasthin."

COMPLIMENTARY TRIAL SUPPLY TO READERS

A supply of "Antineurasthin," amply sufficient to demonstrate its wonderful brain-and-nerve-nourishing and nerve-sustaining qualities, is obtainable without payment. Two penny stamps for postage should, however, be enclosed as a matter of courtesy.

Card or letter application, with the stamps, should be addressed to the Antineurasthin Co., 130, Botolph House, Eastcheap, London, E.C.

With the complimentary trial supply will also be sent a pamphlet entitled "Nervous Disorders," together with a scientific review by Dr. Kuhner.

A NECESSITY When on Tour

A Folding Map for Motor Cyclists

(In Strong Case).

When on tour the motor cyclist is often faced with the question of which road to take or the best way to reach a certain place. All such difficulties can be overcome by carrying "The Autocar" Folding Map in your kit. It occupies very little space, as when folded it measures only 7½ in. × 9½ in. All main roads are marked in red, and the distances between all important towns are given.

PRICE 8/10, Carriage Paid.

Please mention that the folding map is required when ordering.

The Offices of "The Motor Cycle," 20, Tudor Street, London, E.C.

Another Advantage of Joining the M.U.

The Motor Union is offering a further addition to the privileges of membership. Members joining the Union now will receive for the usual annual subscription an extended membership from the 1st October, 1908, to 31st December, 1909, and will receive a copy of *The Motor Cycle* free from the date of joining to the 31st December, 1909.

A Separate Number for Every Motor Cycle.

Practically every motor cyclist knows that a registered number only applies to one motor cycle, and that the purchase of a new machine entails a fresh registration in every case. However, there are evidently a few riders who are still ignorant of this provision of the Motor Car Act, as an instance came under our notice recently where a motor cyclist had ridden three machines during five years, all of one make, with one registered number. He was under the impression that the change of number was only necessary in the case of a change of make, whereas if fifty machines of one make were bought in one year it would be necessary to have a fresh registration number for each one; otherwise it is impossible for the authorities to keep trace of the owner. The transfer of a registered number to a fresh owner can, of course, be made on payment of 1s., and it is sometimes possible to cancel the old numbers and have them re-allotted to new machines, but only by courtesy of the officials and payment of another 5s.

Sevenoaks Motor Cycle Fatality.

A very serious collision occurred on Pol Hill, on the Sevenoaks Road, on Sunday, 13th inst. A Bromley motor cyclist, Mr. T. Sheldon, was driving his 5 h.p. Peugeot up Pol Hill when at the sharp bend of the hill, in pulling out from behind a cart, he collided with another motor cyclist who was descending the hill. Mr. Sheldon was badly hurt and died the following Tuesday. The other victim was also hurt but not seriously.

The Inquest.

At the inquest on Mr. Sheldon at Bromley, Mr. A. O. Busbridge, of Woolwich, who collided, said deceased was driving uphill at the time on the wrong side; he sounded his horn when he pulled over to his right side, but too late to avoid a collision. Mr. Bourdon, the veteran cycle and motor agent, referred to deceased as a careful driver, but who drove at legal limit speed sometimes. After several witnesses had given evidence the jury returned a verdict of "Accidental death," no blame in their opinion being attached to Mr. Busbridge.

M.U. Handle-bar Badge.

The Motor Union cycle badge is still in demand, a total of 190 being issued up to the week ending 12th September, 1908. Besides the ordinary advantages of the badge, the special advantage is

that a member charged with an offence while carrying the badge is entitled to have half of his legal expenses paid, if they do not exceed £10; and a grant of £5 when they do exceed £10, provided that the Legal Cases Committee of the Union is satisfied that he did not commit the offence with which he was charged. The price charged for the use of the badge is 6s., and is not an annual charge, but the badge remains the property of the member so long as he continues his membership of the Union.

bicycles, of which the engines, if twin-cylinder, do not exceed 85 mm. by 95 mm. for each cylinder. Starters barred. Distance 5½ miles. Twenty-five entries, or the race may be void at the option of the executive. Entries close on Saturday next to the Clerk of the Course, Brooklands Automobile Racing Club, Carlton House, Regent Street, S.W., the fee being 10s. 6d. p.p.

Winter Roads.

Until the advent of the rubber-studded motor cycle tyres sideslip was almost inevitable under certain conditions of road surface. Certainly, steel-studded bands prevented sideslip on greasy roads, but they caused bad sideslips occasionally on granite setts either dry or wet. Riding on winter roads should have no terrors now for the average motor cyclist who is well protected from cold and wet. Our advice to every motor cyclist who wishes to ride his machine during the winter months, and under all weather conditions, is to procure a pair of rubber-studded covers, or have rubber-studded covers vulcanised to his existing tyres.

A New York Show.

The Ninth International Automobile Show organised by the American Motor Car Manufacturers' Association will be held in the Grand Central Palace, New York, from December 31st, 1908, to January 7th, 1909. Manufacturers who desire to secure space should communicate with the secretary, Spalding Building, 29, West 42nd Street, New York, before October 1st, 1908.

Tyres and Accessories.

The issues of *The Motor Cycle* for October 7th, 14th, and 21st will contain specially illustrated articles on motor cycle tyres and accessories.

FUTURE EVENTS.

- Oct. 2—Gaillon Hill-climb, France.
- " 3—Bradford M.C.C. Open Hill-climb for Motor Cycles.
- " 3—Brooklands A.R.C. Meeting (Motor Cycle Handicap).
- " 3—Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.
- " 10—Auto Cycle Union Council Meeting at Leamington Spa.
- " 17—Auto Cycle Union Quarterly Trial of Motor Cycles, Uxbridge to Banbury and back.
- " 21—Motor Union General Committee Meeting.
- Nov. 20-28—Thirty-second Annual Stanley Show, at the Agricultural Hall, Islington.
- " 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.
- Dec. 16—Motor Union General Committee Meeting.

The Brooklands Motor Cycle Race.

The motor cycle handicap plate of 25 sovs. will be run on the 3rd prox. on the Brooklands Track, the entrant of the winner to receive 15 sovs., the entrant of the second 7 sovs., and the entrant of the third 3 sovs. For motor

J. Lang (6 h.p. N.S.U.) changing a plug during early morning practice in the Isle of Man. The T.T. machines in the background are R. M. Brice's 3½ h.p. Brown and W. H. Bashall's 6 h.p. Bat-Jap.

The Motor Cycle Tourist Trophy Race.

Practising on the T.T. Course.

SOME good practice was put in by the T.T. competitors during the latter part of last week. Friday was almost a perfect day, as the weather and roads were both favourable. C. R. Collier was credited with the fastest lap among the single-cylinder competitors on Friday, as he got round in

Robert Ellis (3½ h.p. Rex) at Peel.

about 22m. Godfrey's time was 24m., and Brice's 25m. The two Colliers, Marshall, Newsome, Slaughter, Ellis, Gibson, Franklin, McMinnies, Cooper, Brown, Barker, and Godfrey in the single-cylinder class, Rem Fowler, Bashall, Gurr, Woodhouse, Heaton, Smythe, Applebee, Clark, and Baxter in the multi-cylinder class were out, but the circuit times were variable, as numerous stoppages were made to make adjustments. Saturday morning was dismal, owing to thick mist, and overnight heavy rain fell, but later the sun appeared, so that good practice was possible. In addition to the competitors above mentioned, Sir R. K. Arbuthnot was out practising, also Geiger and Bell.

The T.T. Prize Fund.

The amount received towards the above fund and already recorded is £91 16s. 3d. Additional contributions to the fund received up to Friday last are:

	£	s.	d.
J. W. G. Brooker	10	6	
J. K. Starley	1	1	0
Mrs. Schulte	1	1	0
Price's Patent Candle Co.	1	1	0
Moto-Rêve Co., Ltd.	3	3	0
Dr. H. R. Mayo	1	1	0
Amount previously acknowledged	91	16	3
Total	£99	13	9

The T.T. Shilling Fund.

Staff and employees Triumph Cycle Co., Ltd. (84), A. J. Sproston (20), T. F. Cox (5), E. Nelson (5), H. P. E. Harding (5), Two Irish Police (2), W. Simms, H. Lister Cooper, G. T. Willan, J. Harwood, D. K. Hall, S. Turnpenny, A. S. Blanch, E. J. Chapman, M. G. Duncan, A. Sharp, L. Newhall, and H. H. Bowen (1 each).

The funds have been established to provide cash prizes, and if possible help to defray the expenses, necessarily very heavy, of holding this year's International Tourist Trophy Race for Motor Cycles.

Cash Prizes for the Winners.

In addition to the Tourist Trophy (presented by the Marquis de Mouzilly de St. Mars), to be won in the single-cylinder class, and Dr. H. S. Hele-Shaw's trophy in the multi-cylinder class, cash prizes will be given as follows:

£25 to the rider arriving first in each class.

£15 to the rider arriving second in each class, provided there are six starters or more in each class.

£10 to the rider arriving third in each class, provided there are twelve starters or more in each class.

Additional prizes of £5 will be awarded to the private owner in each class, provided he is not amongst the first three, and that his performance is sufficiently meritorious.

A. W. Gamage, Ltd., Holborn, E.C., advise us that they have just been appointed sole agents for Robilac enamel, and hold a large stock of this enamel in French grey, black, and other colours.

"THE AUTOCAR" MOTOR CAR LECTURES.

THE fee for the above course of eight lectures on the petrol engine, frame, gear, and other components of the modern motor car, already referred to in these columns, is one guinea. This will enable motor cyclists who are not conversant with the mechanism of their engines to gain an insight into every working part. The petrol engine, whether fitted on a car or motor cycle, works on the same principle, so that, although the lectures will deal primarily with motor cars, they will be of equal interest to motor cyclists, because not only will they gain knowledge regarding motor cycle engines, but information respecting the mechanism of motor cars, to which they may aspire later, will also be imparted to them at the same time. There are one or two alterations in the particulars announced last week. For instance, in Leeds the University will be the building in which the lectures will be given, not the

Yorkshire College; in Birmingham the University, Edmund Street, is the building selected, and the evening Wednesday, commencing October 21st, at 7.30 (not the 14th).

Members of the Motor Union will be interested to read that they can obtain the tickets for the full course of eight lectures at the reduced charge of 12s. 6d. on application to the secretary, 1, Albemarle Street, W. Ordinary tickets may be purchased from the secretary of the Lecture Department, 20, Tudor Street, E.C.

The handy little accessory illustrated has been introduced by Messrs. J. W. Greenwood, Ltd., Portland Place Works, Halifax. The lamp iron can be turned to any angle, as well as the turntable socket into which it fits.

DOUGLAS, Monday, September 21st.

We arrived in the island on Monday afternoon last in company with a number of other motor cyclists, the majority of whom had brought their machines with them. On approaching land Snaefell was seen to be shrouded in mist, and a damp pall hung about, showing that heavy rain had recently fallen. Once ashore, the number of motor bicycles struck us as being quite remarkable. On the two previous occasions on which motor cycle events have been held over here comparatively few machines have been brought over, but this year things are different, and in the afternoon on the road from Douglas to Saint John's they literally abounded. After the heavy rain the roads were in an appalling condition, being covered with greasy slime—in fact, Brice remarked to us that they were almost as treacherous as those encountered

examined the competing machines to see if they conformed to the conditions, and allowed each man his supply of petrol. For each rider of a single-cylinder machine two cans of different colours have been supplied—one (blue) holds a gallon, and the other (white) the remainder, 4 pts. 13 ozs. In the case of a rider of a twin-cylinder machine, one can (green) holds $1\frac{1}{4}$ gallons, and the other, which is likewise of a different colour, the remainder, 3 pts. $16\frac{1}{4}$ ozs.

Another test carried out this morning consisted of getting the men to drive their machines on full throttle from Ballacraigne to St. John's, so that the judges stationed near the latter village could testify that the machines were fitted with efficient silencers.

It is a matter for congratulation that not a single accident deserving of mention has occurred during the motor cycle practice—a fact which should help considerably to popularise the pastime.

DOUGLAS, Tuesday, September 22nd.

It was dull and misty in the early hours of this morning, but the day showed promise of being a fine one. The road from Douglas to St. John's had improved somewhat, and it seems likely that the greasy patches under the trees in the valleys may improve.

All the thirty-seven competitors save Varney have arrived at the starting post, and H. A. Collier states that he is ready to ride. The organisation is excellent. Each machine was emptied of petrol and then carefully supervised by the judges in the officials' enclosure. The machines were taken to a grass plot by the side of the course; each rider was stationed opposite his own number, at which was also his steward with the two coloured tins of petrol, a funnel, and a can opener. The spirit was measured out yesterday in special measures, accurately made to avoid spilling. A capital scoring board has been erected at the foot of Tynwald Hill, on which the numbers, names of machines and riders, the number of laps, and the times may be seen at a glance.

The Start.

The start took place at a point exactly opposite the telegraph office at St. John's, facing which was the timekeepers' tent, containing Messrs. Ebbelwhite, Glazebrook, and Mallam. The competitors and their machines were ranged up in a double line, singles on one side of the road and twins on the other. At 10.17 a.m. the two first men, C. R. Collier and H. Rem Fowler, were sent on their journey.

The winner of the single cylinder class. J. Marshall, whose $3\frac{1}{2}$ h.p. Triumph was in fine fettle for speed work.

in Derbyshire. At St. John's at about 5 p.m. many of the competitors were busy practising. Rem Fowler and Perryman on twin Nortons took the corner just past the start in excellent form, and in the yard of the inn hard by Brice, Bashall, and Tessier were putting the finishing touches to their machines. At the time of writing all the competitors have arrived except Varney (7 h.p. Crownfield), who telegraphs that he has met with an accident, and will be unable to compete; there is also some doubt as to whether H. A. Collier ($3\frac{1}{2}$ h.p. Matchless-Jap) will start, as he is said to be indisposed this morning. The officials

The Tourist Trophy Race.—

The sun was shining brightly, the weather was glorious, and the roads were rapidly drying. All started except E. Varney, and almost all without exception got away in excellent style. One of the most thrilling starts was made by Gurr's four-cylinder F.N., which showed itself capable of exceedingly rapid acceleration. J. C. Smythe started with a compression tap open and had to stop. S. C. Perryman failed to get going for some distance.

The spectators, of whom a great number were present, showed the greatest possible enthusiasm.

The following were the names of the competitors and their machines:

SINGLE-CYLINDER CLASS.

	Rider and machine.	Bore & stroke.
1.	C. R. Collier (3½ h.p. Matchless-J.A.P.)	85 × 76 mm.
3.	H. A. Collier (3½ h.p. Matchless-J.A.P.)	85 × 76 mm.
5.	J. Marshall (3½ h.p. Triumph) ...	84 × 86 mm.
6.	W. F. Newsome (3½ h.p. Triumph) ...	84 × 86 mm.
7.	J. Slaughter (3½ h.p. Triumph) ...	84 × 86 mm.
*10.	Robert Ellis (3½ h.p. Rex)	83 × 89 mm.
*12.	Gordon Gibson (3½ h.p. Triumph) ...	84 × 86 mm.
*15.	C. B. Franklin (3½ h.p. Chater-Lea-J.A.P.) ...	85 × 85 mm.
17.	R. M. Brice (3½ h.p. Brown) ...	83 × 89 mm.†
*21.	W. G. McMinnies (3½ h.p. Triumph) ...	84 × 86 mm.
*22.	H. Lister Cooper (3½ h.p. Triumph) ...	84 × 86 mm.
*24.	Capt. Sir R. K. Arbuthnot, Bart., R.N. (3½ h.p. Triumph) ...	84 × 86 mm.
27.	F. E. Barker (3½ h.p. Rex) ...	82 × 89 mm.
30.	O. C. Godfrey (3½ h.p. Rex) ...	82 × 89 mm.
34.	R. Bell (3½ h.p. N.S.U.) ...	80 × 80 mm.

MULTI-CYLINDER CLASS.

	Rider and machine.	Bore & stroke.
*2.	H. Rem Fowler (5 h.p. Norton) ...	76 × 80 mm.
4.	H. V. Colver (7 h.p. Matchless-J.A.P.)	85 × 85 mm.†
8.	R. M. White (6-7 h.p. Bat-J.A.P.) ...	85 × 76 mm.
9.	W. H. Wells (5 h.p. Vindec-Special) ...	75 × 76 mm.
*11.	W. H. Bashall (6-7 h.p. Bat) ...	76 × 95 mm.
*14.	Noel E. Drury (5 h.p. Matchless-J.A.P.)	85 × 60 mm.†
*16.	S. C. Perryman (5 h.p. Norton) ...	76 × 80 mm.
18.	C. E. Bennett (5 h.p. Vindec-Special)	75 × 76 mm.
*19.	W. Gurr (5 h.p. four-cylinder F.N.) ...	50 × 57 mm.
*20.	A. Moorhouse (5 h.p. Rex) ...	76 × 80 mm.
23.	E. G. Young (3½ h.p. Acme) ...	68 × 75 mm.
*25.	E. Varney (7 h.p. Crownfield) ...	76 × 98 mm.†
26.	H. Reed (5 h.p. Dot) ...	75 × 75 mm.
28.	W. Heaton (5 h.p. Rex) ...	76 × 80 mm.
29.	J. C. Smythe (5 h.p. Rex) ...	76 × 80 mm.
31.	F. Applebee, jun. (5 h.p. Rex) ...	76 × 80 mm.
32.	R. O. Clark (5 h.p. four-cylinder F.N.)	50 × 57 mm.
33.	M. Geiger (4 h.p. N.S.U.) ...	64 × 85 mm.
35.	E. Genisa (3½ h.p. Acme) ...	68 × 76 mm.
*36.	J. O. M. Dixon (5 h.p. Vindec-Special)...	75 × 75 mm.
*37.	J. Lang (6 h.p. N.S.U.) ...	75 × 90 mm.
*38.	J. Baxter (5 h.p. Rex) ...	77 × 78 mm.

* Private owners.

†Signifies plain coil ignition; all others had magnetos.

The men were started at intervals of two minutes, and in an incredibly short space of time the leaders came tearing by, having completed the first lap of 15 miles 1,430 yards.

Those who have made fast times on the first circuit are: J. Marshall, time 22m. 54s., averaging 41.4 miles per hour; W. H. Bashall, 23m. 3s.; and C. E. Bennett, 23m. 19s. Most of the men seem to be covering the circuits—15.81 miles—in an average time of about 27m. J. Baxter is said to have collided with the hedge at Ballacrairie Corner. Perryman on his second round passes the starting point with his spare belt hanging loose, and has to stop a few yards further on to secure it. At the end of his second round J. Marshall is still maintaining his lead, his time being 22m. 49s., thus having improved 5s. on his previous lap. Gurr's

sensational start has apparently availed him little, and Genisa's Acme has apparently been in trouble. This and the Acme ridden by E. G. Young are the smallest twin-cylinder machines in the race.

J. Baxter, who was reported to have retired, got going again, and completed the first round in about 56m. Most of the men are running most consistently, but of the few absentees no news has yet arrived. Smythe at the end of his third lap has stopped at the enclosure to replace a broken exhaust valve spring. Ellis broke a petrol pipe after having lowered the tank to allow the petrol to be properly drained out, thus putting an unfair strain on the pipe. This has compelled him to retire. Bennett's exhaust pipe came adrift, so he stopped opposite the timekeeper's tent, asked leave to continue, and, having received this, has restarted.

Ellis reports the course as being in splendid order, the roads being firm and devoid of dust. Collier at the end of his fifth round reports the course to be in

W. H. Wells cutting out the pace over the bridge between Peel and St. John's.

good order but bumpy. Immediately after the start he was troubled by misfiring, and he had to change a plug before reaching Creg Willey's Hill. Gurr retired without completing a round. At the end of the third round Marshall still maintained his lead, covering the lap in 22m. 45s. Next came C. R. Collier, time 18m. 18s.; followed by Colver, 23m. 23s. At the end of the fourth round, C. Collier took the lead, and covered the four laps in 1h. 35m. 28s. Bashall was next in order; time 1h. 36m. 20s.; circuit time, 22m. 35s.—the fastest so far. McMinnies held third place, time 1h. 38m. 17s. Bashall's average speed was 42.3 miles per hour.

The Half Distance.

At the end of the fifth round, every competitor was stopped at the enclosure and his own particular steward allotted him the remainder of his petrol. The first man to arrive at half-time was C. R. Collier.

At half distance the enclosure became a scene of great activity; men arrived in quick succession, just had time to snatch a little refreshment, and then filled up and restarted. Captain Arbuthnot arrived in excellent spirits, and said it was the biggest fun he had ever had in his life, and restarted as happy as a king, but with his tank none too full of petrol. News of troubles great and small came in thick and fast just at this time. Moorhouse broke a sparking plug early in the race, and pieces of the porcelain insulation got into

The Tourist Trophy Race.—

the inlet valve. J. Lang was troubled with a slipping belt, and had to put on his spare during his running time. F. E. Barker was reported to have retired with a broken crankshaft. W. H. Bashall stopped 8m. with a broken petrol pipe, and then restarted. Geiger restarted after the half-time interval with a full petrol tank. Many of the men were doing very well on their fuel allowance, but the question was, Would they correctly judge both speed and consumption?

Positions at Half Distance.

At the end of the fifth lap Collier kept his lead, time for the distance, 2h. 8m. 49s.; circuit time, 3m. 21s. Bashall was next in order of speed, 2h. 8m. 54s.; circuit time, 3m. 34s. Marshall held third place, time 2h. 11m. 7s.; circuit time 2m. 39s. In this round both Newsome and White made exactly the same time, namely, 2h. 15m. 25s. In the sixth round the race had practically resolved itself into a duel between C. R. Collier and J. Marshall, although Bashall, Wells, White, and Newsome were pressing hard on them, only a few minutes separating the leading riders. The times at half distance stood as follow: Collier, 2h. 32m. 18s.; Marshall, 2h. 33m. 53s.; Wells, 2h. 37m. 47s.; Bashall, 2h. 38m. 25s.; White, 2h. 38m. 47s.; Newsome, 2h. 40m. 26s. The above was the position of the race at half the distance, but whether or not the leaders would have sufficient petrol on which to finish no man could tell. News of two retirements came to hand—White had a stripped magneto union and Genisa a broken cylinder.

In the seventh round Marshall had gained on Collier, and was now only 49s. behind him, Collier's nett time being 2h. 56m. 8s., Marshall's 2h. 56m. 57s.

C. R. Collier (3½ h.p. Matchless-Jap), last year's winner, nearing Peel. In 1907 J. Marshall was second, but the positions were reversed in Tuesday's race.

At the end of the eighth round Marshall took the lead, his time being 3h. 19m. 30s. and Collier's 3h. 19m. 58s., and he was thus 28s. ahead. The following riders did not arrive at half-time: E. G. Young, F. E. Barker (broken piston), W. Heaton, and F. Applebee, jun. H. V. Colver experienced a puncture, which he repaired, and got going again.

R. Bell did not start on his fifth round till very late, having had many punctures. In the ninth lap Marshall increased his lead, and completed the circuit in 22m. 20s., average speed, 42.4 miles per hour, thus improving on Bashall's fourth lap time of

Capt. Sir R. K. Arbuthnot, Bart., R.N., who finished third—thirteen minutes behind the winner. This performance was quite the best of the private owners.

22m. 25s. Marshall's nett time was 3h. 41m. 50s., and Collier's 3h. 43m. 52s. As the time for the completion of the tenth lap drew near the excitement of the spectators rose to fever heat. At last Marshall came in sight, this time leading by 200 yards. Collier came next 2m. 16⅓s. behind in point of time. Marshall's ride was a splendid performance, especially as on his third round he had to replace an exhaust valve. He completed the distance in 4h. 4m. 50⅓s. The amount of petrol left in his tank was 38 ozs., showing he could have driven faster if he had been able to tell the amount of petrol he had left whilst running. His average speed throughout the race was 38.7 miles per hour. Collier covered the course in 4h. 7m. 6⅔s.; he had 22 ozs. of petrol left. Captain Arbuthnot came in third, having completed the course in 4h. 17m. 57s. Thus a 3½ h.p. Triumph won, a 3½ h.p. Matchless was second, and a 3½ h.p. Triumph third.

In the twin-cylinder class H. Reed (5 h.p. Dot-Peugeot) came in first in 4h. 15m. 58⅓s., average speed 37 m.p.h., residue of petrol 23½ ozs.; 2, W. H. Bashall (6 h.p. Bat-J.A.P.), 4h. 18m. 15s.; 3, R. O. Clark (5 h.p. four-cylinder F.N.), 4h. 21m. 2s. Bashall had 21 ozs. of petrol left at the end of the race, and Clark 58 ozs.

Following on the first three in the single and twin-cylinder classes, the results are as hereunder: W. F. Newsome (3½ h.p. Triumph), 4h. 22m. 9⅔s., residue of petrol 41½ ozs.; W. G. McMinnies (3½ h.p. Triumph), 4h. 33m. 24⅔s., residue of petrol 48 ozs.; C. B. Franklin (3½ h.p. Chater-Lea-J.A.P.), 4h. 40m. 32⅔s., residue of petrol 45¼ ozs.; H. L. Cooper (3½ h.p. Triumph), 4h. 43m. 36⅔s., residue of petrol 22 ozs.; O. C. Godfrey (3½ h.p. Rex), 4h. 43m. 54⅓s., residue of petrol 6 ozs.; R. M. Brice (3½ h.p. Brown), 4h. 49m. 58⅓s., residue of petrol 22 ozs.; G. Gibson (3½ h.p. Triumph), residue of petrol 10½ ozs. In this class H. Collier ran out of petrol, and Slaughter, Barker, Ellis, and Bell retired.

The Tourist Trophy Race.—

In the twin class Wells (5 h.p. Vindec) ran out of petrol just short of finishing his last round, or he would have held fourth place; time 4h. 25m. 15 $\frac{3}{4}$ s. J. Lang (6 h.p. N.S.U.), 4h. 32m. 41s.; residue of petrol 16 ozs. N. E. Drury (5 h.p. Jap), 4h. 35m. 56 $\frac{2}{5}$ s.; residue 10 ozs. A. J. Moorhouse (5 h.p. Rex) ran out of petrol, and had to push six miles; time, 4h. 55m. 26s. H. V. Colver (7 h.p. Matchless-Jap) ran out of petrol; time, 5h. 2m. 52s. J. O. M. Dixon (5 h.p. Vindec), 4h. 56m. 57s.; residue 8 ozs. S. C. Perryman (5 h.p. Norton), 5h. 22m. 21s.

The event was even more successful than last year, and considering that the machines were driven to their utmost limits they proved themselves most reliable. It is a matter for congratulation that not a single untoward incident of any kind marred the success of the race.

THE TOURIST TROPHY WINNER. J. Marshall, the fastest rider in the T.T. race. His mount was a 3 $\frac{1}{2}$ h.p. Triumph with Bosch magneto and Dunlop tyres. The average speed for 158 miles 220 yards was 38.7 miles per hour, and the petrol consumption well over 100 miles to the gallon.

In the 1907 race we may state for comparison that C. R. Collier (3 $\frac{1}{2}$ h.p. Matchless) won the single-cylinder class in 4h. 8m. 8 $\frac{1}{5}$ s.; average speed, 38.2 miles per hour; petrol consumption, 94 $\frac{1}{2}$ miles per gallon. 2, J. Marshall (3 $\frac{1}{2}$ h.p. Triumph); time, 4h. 19m. 47 $\frac{2}{5}$ s.; speed, 36.5 miles per hour; petrol consumption, 114 miles per gallon. 3, F. Hulbert (3 $\frac{1}{2}$ h.p. Triumph); time, 4h. 27m. 49 $\frac{3}{5}$ s.; speed, 35.4 miles per hour; petrol consumption, 90 miles to the gallon.

In the twin-cylinder class H. Rem Fowler (5 h.p. Norton) was victorious; time, 4h. 21m. 52 $\frac{4}{5}$ s.; speed, 36.2 miles per hour; petrol consumption, 87 miles per gallon. 2, W. H. Wells (5 h.p. Vindec); time, 4h. 53m. 41 $\frac{1}{5}$ s.; speed, 32.3 miles per hour; petrol consumption, 77 miles per gallon. 3, W. Heaton (5 h.p. Rex); time, 5h. 11m. 34 $\frac{4}{5}$ s.; speed, 30.5 miles per hour; petrol consumption, 107 miles per gallon.

This year's contest has proved beyond doubt the usefulness of the race, for, on a reduced allowance of petrol, the foremost riders in both classes averaged a greater speed than was accomplished last year. H. Rem Fowler's fastest circuit in 1907 (22m. 6 $\frac{2}{5}$ s.) still remains unbeaten, for Marshall, who rode the fastest circuit on Tuesday, was 13 $\frac{3}{5}$ s. slower, his time being 22m. 20s.

We should like to take this opportunity of expressing our indebtedness to the Moto-Rêve Co. for placing a 2 h.p. Moto-Rêve at our disposal, and to Mr. Hughes, cycle agent, Wellington Street, Douglas, Isle of Man, for whose kindness the safe transmission of the above telegraphed description of the race from St. John's to Douglas per motor cycle was responsible.

SADDLE POSITION.

THE advantages of a low saddle position on a motor bicycle are fully acknowledged, but a want is only too often a very different thing from fulfilling it. Probably a good many others besides the writer have puzzled and schemed how to arrange a low seat on a high frame, so that it should be possible to sit astride the machine with the feet planted firmly on the ground. When a low saddle position is attained by the use of long armed pillar dropping down and extending back over the rear wheel, it involves an abuse of the frame which that member is neither designed nor well adapted to withstand.

But to return to the rider who is already in possession of a machine the saddle of which is more elevated than he cares for, even when lowered as far as

H. Reed, Manchester, the winner of the Multi-cylinder Class; average speed, 37.11 miles per hour. His mount was a 5 h.p. Dot-Peugeot, with Bosch magneto, Amac carburetter, and Dunlop tyres.

it will go. Remove the saddle and note how far the cross bolt of the saddle clip lies below the base of the saddle when the clip is inverted. Now remove the clip and hold—or, better, get someone else to hold—the saddle in place on the machine, being careful to get just the right tilt. Then mark on each side of the seat or saddle lug (which connects the saddle stays to the top of the diagonal or seat tube) a point as much below the saddle base as the clip pin lay. The lug is then drilled transversely with these points as centres, so that they should be as nearly in the middle of the lug as circumstances will allow. Before starting to drill, a well-fitting wooden or metal plug should be pushed a little distance down the diagonal tube to prevent the drillings (and subsequently dirt and dust) falling down the tube into the bottom bracket bearings; the hole should be drilled just large enough to receive the saddle clip bolt. The strap or arched part of the clip will not be wanted, but the serrated washers should be fitted to the saddle frame, and the bolt passed through them as in their original condition. Then, when the nuts are screwed on to the ends of the bolt, the saddle will be fixed in its new position. G. D. L.

CLUB NEWS.

Wakefield M.C.

The hill chosen for the first competition was Haigh, near Barnsley. The results were: 1, Mr. Spivey (2½ h.p. Minerva); 2, E. Slater, jun. (3½ h.p. Triumph); 3, Dr. S. Reader (3½ h.p. Triumph). Mr. E. Slater made the fastest time.

Perth and District M.C.C.

The Perth and District M.C.C. held a "Maximum Difference" hill-climb on Lochton House hill on Saturday, the 12th inst. The fastest and slowest times over the course (about half a mile) were respectively 1m. 15s. and 5m. 50s. The first four in order of merit were W. Bachelor, B. Syme, T. W. Frew, and W. J. Sommerville. The slow section of the climb was "paced" by several local pedestrians.

Lincolnshire M.C.C. (Grantham Centre).

An enjoyable combined meet of the Lines. and Notts M.C.C.'s was held at Newark on September 13th. After partaking of an excellent lunch at the Ossington, under the guidance of the genial Notts captain, Mr. Young, the party explored the historic ruins of Newark Castle. Returning home, great care had to be taken by the Grantham riders owing to police traps.

Middlesbrough and District M.C.C.

A most successful hill-climbing test was held on Yearby Bank under the auspices of the Middlesbrough and District Motor Cycle Club. The names of the competitors and their machines are: Messrs. J. H. Dale, 3½ h.p. N.S.U.; G. W. Liddle, 3½ h.p. Triumph; W. A. Duchars, 3½ h.p. Rex; W. A. George, 3½ h.p. Rex; H. Brine, 5 h.p. Antoine; W. Danby, 2 h.p. Moto Réve; R. W. Day, 3½ h.p. N.S.U.; G. R. Sanderson, 3½ h.p. Triumph; and —. Burnett, 5 h.p. Rex. The following are the results on formula: 1, G. R. Sanderson, figure of merit, .0088; 2, R. W. Day, .0086; 3, G. W. Liddle, .0084; 4 and 5, J. H. Dale and W. Danby, .0082; 6, W. A. George, .0078; 7, W. A. Duchars, .0072; 8, H. Brine, .0063; 9, Mr. Burnett, .0056.

On the 23rd inst. a petrol consumption trial has been arranged, starting from Marton Bungalow, at 3 p.m. over a twenty mile course; entry fee, 1s.

Stockport and District M.C.C.

The first hill-climb was held on Saturday, the 12th inst., and about fourteen members took part in the competition. The times were taken by Messrs. T. Gibbons and H. Swain by means of ordinary stop watches. Mr. A. Mugeli acted as starter. Results on formula:

Class 1.—1, T. Gibbons (3½ h.p. Triumph); 2, F. M. Nawell (3½ h.p. Triumph); 3, F. Briggs (3½ h.p. Midget bicar).

Class 2.—1, F. Allen (5 h.p. Peugeot); 2, H. C. Turner (5 h.p. Rex); 3, J. Woodrow (5 h.p. Rex).

Results on time.		Total weight.	
H. C. Turner (5 h.p. Rex)	...	X	324 lbs.
F. Allen (5 h.p. Peugeot)	...	+ 4s.	341 lbs.
T. Gibbons (3½ h.p. Triumph)	...	+ 9½s.	324 lbs.
F. M. Nawell (3½ h.p. Triumph)	...	+ 19¾s.	336 lbs.
J. Woodrow (5 h.p. Rex)	...	+ 26s.	392 lbs.
W. C. Norman (5 h.p. Rex)	...	+ 42½s.	423 lbs.
F. Briggs (3½ h.p. Midget Bicar)	...	+ 62¾s.	320 lbs.
F. Arthan (5 h.p. Rex)	...	+ 64¾s.	395 lbs.

Fourteen riders took part in the Stockport and District M.C.C.'s first competition, which took the form of a hill climb.

Western District M.C.

The above club held its annual hill-climb at Dashwood on the 20th inst. There was a good muster of members. The fastest time of the day was made by H. Kirk (twin Brown), whilst H. Vowler (3½ h.p. Triumph) made fastest time for single-cylinder machines. The results, decided on A.C.U. formula, will be announced next week.

Motor cyclists joining the club now will be entitled to the full benefits of the club up to the end of 1909 for a subscription of 7s. 6d., with 2s. 6d. entrance. Write to R. R. Babbage, 16, Ripault Road, High Street, Fulham, S.W.

Motor Cycle Union of Ireland. Dublin Centre.

The Dublin Centre of the M.C.U.I. concluded a season of particular activity of the road on Saturday last with a hill-climbing competition at the Long Hill, leading from the Rocky Valley to the top of the Sugarloaf mountain in Co. Wicklow. The afternoon was not an auspicious one, as

Practising for the Tourist Trophy Race. W. H. Eashall and J. Marshall near Peel.

although no rain fell, a heavy cloud hung over the mountain, making the road greasy, as well as upsetting the carburation in the parts where it was particularly thick. The competition was divided into two classes—pedalling and non-pedalling—and in each class the fastest times were made by B. Dumphy and R. Walshe, both of whom rode J.A.P. machines, and did 3m. 5½s. and 3m. 11½s., and 3m. 40¾s. and 4m. 19¾s. respectively. The awards were decided on Professor Callendar's formula, and in the pedalling class Walshe won with 268 points to Dumphy's 295, while in the non-pedalling class Dumphy scored with 303 points to 312. The times were taken by Messrs. J. A. Armstrong and T. W. Murphy.

Ulster Centre.

At a meeting of the committee, held in the Grand Central Hotel, Belfast, on Friday, 18th inst., the result of the Muratti Trophy Competition was further considered. As Messrs. J. Stewart and C. E. Murphy had again finished exactly equal in points, it was decided to ascertain whether they would prefer to be declared joint holders of the trophy for 1908, with half a win each, or reride the Derry portion of the course again with a difference of fifteen minutes in the starting time.

A letter was read from the Triumph Cycle Co., Ltd., offering to present another trophy for an inter-centre contest, to take the place of the one which became the property of the Ulster Centre this year, and a resolution was passed thanking them for their generosity.

It was reported that permission had been given by the Bangor Urban Council to hold a hill-climbing competition at Central Avenue on Saturday, October 3rd, starting at 3.30 p.m., and arrangements were made accordingly. In the motor cycle section there will be a class confined to private owners and a class open to all members.

The President of the centre, the Marquis de Mouzilly St. Mars, wrote enclosing a cheque towards the prize fund.

Three new members were elected.

Club News.—

Bradford M.C.C.

The above club has received permission to hold the open hill-climb on the 3rd prox. on a hill which can best be reached *via* Keighley. It is situated one and a half miles from Oxenhope, has an average gradient of 1 in 10, and is one and a quarter miles in length.

Great Yarmouth and District M.C.C.

Readers will be interested to know what slow speeds a motor cycle is capable of when the rider wishes to travel very slowly, as in a tortoise race at a gymkhana. We understand that Mr. F. G. Galley occupied 5m. 43s. in covering 260 yards on his Anglian motor bicycle at the Great Yarmouth and District M.C.C. gymkhana. This is equal to a speed of $1\frac{1}{2}$ m.p.h. The Anglian two-speed gear was used.

Leeds M.C.C.

The above club held its annual speed trials on a private road at Templenewsam by kind permission of the Hon. E. L. Wood on Saturday, the 12th inst. Entries were divided into five classes, according to type of machine and size of engine, and with the exception of Class 2, were well supported. At the close of the competition an open class was run off, entries for this being taken on the spot. Electrical timing was employed, and Messrs. Langton, Fawcett, and Atkinson were the officials. The results are as follows:

Class 1 (for engines 76 by 76 mm.)—1, H. Simpson, $2\frac{3}{4}$ h.p. Royal Cavendish; 2, M. J. Kitchen, $2\frac{3}{4}$ h.p. N.S.U.; 3, T. W. Wake, $2\frac{1}{2}$ h.p. Ariel.

Class 2 (for engines 80 by 80 mm.)—Void. Insufficient entries.

Newcastle and District M.C.C.

The result of the team trials over a course of ninety miles is as follows:

First Team.—L. Rosenvinge ($3\frac{3}{4}$ h.p. N.S.U.), 90 marks; K. Rheinart ($3\frac{1}{2}$ h.p. N.S.U.), 75 (15 marks deducted for being 3m. too soon); B. Bradford (6 h.p. J.A.P.), 73. Total, 238 marks.

Second Team.—E. L. Bates ($5\frac{1}{2}$ h.p. N.S.U.), $49\frac{1}{4}$ marks; S. Hudson ($3\frac{1}{2}$ h.p. Hobart), 85; D. Mallett (4 h.p. N.S.U.), 85; E. Nicholson (6 h.p. N.S.U.), no marks allowed. Total, $219\frac{1}{4}$ marks. Hudson and Mallett lost 5 marks for being too soon.

Third Team.—T. W. Hall ($3\frac{1}{2}$ h.p. Quadrant), 90 marks; J. J. Hall (3 h.p. Quadrant), 18. Total, 108 marks.

The hill-climb has been declared off on account of police interference.

The competition for teams of three was run off on Sept. 13th, over a course of 135 miles to Kelso and back, and resulted as follows:

First Team.—S. W. Carty ($3\frac{3}{4}$ h.p. N.S.U.), L. Rosenvinge ($3\frac{3}{4}$ h.p. N.S.U.), and K. Rheinart (6 h.p. N.S.U.), $10\frac{1}{2}$ s. behind minimum time.

Second team.—Robson Crosier ($3\frac{1}{2}$ h.p. N.S.U.), R. L. Atkinson ($3\frac{3}{4}$ h.p. N.S.U.), and H. M. C. Bell (4 h.p. N.S.U.), 5m. behind minimum time.

Third Team.—L. Dixon ($3\frac{1}{2}$ h.p. Triumph), E. Parker ($3\frac{1}{2}$ h.p. N.S.U.), and D. Mallett (4 h.p. N.S.U.), outside maximum time.

A large party of members of the Newcastle and District Motor Cycle Club visited the Isle of Man to witness the Tourist Trophy Race.

Competitors in the Hull and East Riding Auto Cycle Club's Speed Judging Competition last Saturday.

Class 3 (for engines 85 by 85 mm.)—1, E. Slater, $3\frac{1}{2}$ h.p. Triumph; 2, J. Percival, $3\frac{1}{2}$ h.p. Triumph; 3, J. A. Mackay, $3\frac{1}{2}$ h.p. Triumph.

Class 4 (for multi-cylinder engines).—1, F. C. Bagshaw, 5 h.p. Rex; 2, R. Bolton, 5 h.p. Rex, J. R. Kelly, 7-8 h.p. Minerva, dead heat; 3, W. P. Allison, $5\frac{1}{2}$ h.p. G.B.

Class 5 (for special or racing machines).—1, E. S. Myers, $3\frac{1}{2}$ h.p. T.T. Triumph; 2, F. C. Bagshaw, 5 h.p. Rex; 3, P. H. Cockcroft, $3\frac{1}{2}$ h.p. T.T. Triumph.

Final (second attempt).—1, H. Simpson (N.S.U. shield and gold medal), 2s. faster; 2, E. Slater (silver medal), $1\frac{1}{16}$ faster; 3, F. C. Bagshaw (bronze medal), 1s. faster; 4, E. S. Myers, $\frac{4}{5}$ s. slower.

Open Class (open to any motor cycle).—1, E. S. Myers, $3\frac{1}{2}$ h.p. T.T. Triumph; 2, W. E. Grange, $3\frac{1}{2}$ h.p. T.T. Triumph; 3, Owen Brooks, 8 h.p. Brook-Buchet.

Lincolnshire M.C.C.

It has been decided that the Palmer cup, offered by Mr. E. J. Mitchell, manager of the Palmer Tyre, Ltd., shall be competed for in a reliability run to London on Saturday, October 24th. The members will stay in town over Saturday night, arrangements having been made for refreshments and hotel accommodation. The cup is to be won outright.

Teams of four are wanted for the team trial for the Brookes cup, the handsome cup offered by Mr. Brookes, the chairman of the Scunthorpe Centre. Arrangements are being made for a meet at Skegness, and for a meet and hill-climb at Elsham with the Hull A.C.C.

Hull and East Riding A.C.C.

The result of the speed-judging contest held from Hull to Hedon on Saturday last, the 19th inst., was: Crawford, rate of speed 14 m.p.h., error .062 fast; Bosville, 14 m.p.h., .117 fast; Loftus, 16 m.p.h., .483 slow; Straker, 12 m.p.h., .521 slow; Mrs. A. Tomlinson, 14 m.p.h., .568 slow; Darnley, 15 m.p.h., .632 slow; McDougall, 15 m.p.h., .789 fast; Pearson, $17\frac{1}{2}$ m.p.h., .961 fast; Brown, 15 m.p.h., .1000 slow; F. Green, 13 m.p.h., 2.062 fast; H. Tomlinson, 16 m.p.h., 2.536 fast; Nicholson, 17 m.p.h., 2.780 fast; Evans, 16 h.p.h., 2.750 fast; G. Mumby, 16 m.p.h., 4.571 fast; Blenkin, 17 m.p.h., 9.470 fast.

Result of speed-judging contest held from Hull to Hedon on same day to decide the ties in the Hull to Scarborough and back reliability trial: 1, T. H. Straker (3 h.p. Triumph); 2, R. Pearson ($3\frac{1}{2}$ h.p. Minerva); 3, R. Akester ($4\frac{1}{2}$ h.p. Rover tricar); 4, G. W. Mumby ($3\frac{1}{2}$ h.p. Triumph). The rate of speed in all cases was $17\frac{1}{2}$ miles an hour.

A $3\frac{1}{2}$ h.p. MILE A MINUTE MACHINE.

At the Leeds M.C.C. open speed trial the fastest time was made by Eric S. Myers on a $3\frac{1}{2}$ h.p. T.T. Triumph, the speed attained being $59\frac{2}{5}$ miles per hour for one-third of a mile, certified by electrical timing. To show the uniform running of the machine we may mention that Myers made three attempts in all, and each time did $20\frac{1}{5}$ s. for the third of a mile. The gear used was $3\frac{1}{4}$ to 1, so that the engine revolutions would be about 2,500 per minute.

Through the Gale on a Tricar.

A FORETASTE OF WINTER.

"A MESSAGE to go to Maxwell's, sir."

To Maxwell's, six miles away, with the roads flooded, and a blizzard blowing dead east!

"At once?" I ask.

"The man didn't say, sir, but he seemed in a hurry."

Where is my heavy coat, the one with the storm cuffs, and that fine broad turn-up collar? Here we are. Button it up well. Surely never had great-coat to keep out such weather as this. As I make my way to the surgery to get my emergency case, and a few bandages, the gale howls round the house in a paroxysm of fury, daring me, with gallons of hail and rain dashed against the window panes, to brave its strength and wrath. But the case may be urgent, surely must be urgent, or they would never send for me in *this*. I must go. I open the front door, and am almost hurled back into the hall. Now out into it, and much ado to haul the door to after me. I reach the garage, where lies my trusty little car, the mud from this morning's round not yet dry on its green sides and red leather seats. I back it down the slight incline from the coach house door, and the rain holds off a little. Thank goodness, perhaps I am going to have a dry passage after all. Out into the road, and the sight ahead, due west, is enough to appal the heart of the stoutest 6 h.p. tricar. A dark, heavy, swift-coming sky. Not clouds, but a whole storm-sky, black and tremendous. Look, it has burst on the hills a mile away, and you can't see them; they are lashed and torn by the pitiless gale, as we shall be directly.

The Start.

Tickle the carburetter, and start it up. All well. Now into the comfortable back seat, and tuck the waterproof rug round, so. As I press the lever slowly forward into the low gear, the first great cold drop splashes, hard driven, on to my face. We rattle over the cobbles, through the narrow winding street, not a soul about on a day like this. Now we are coming to the open road, and, leaving the protection of the houses, we begin to feel the full force of the biting, blustering wind. Once off the cobbles I try to change gear as usual, but the soft explosions, deadened almost to silence by the howling of the gale, are felt too far apart, and the car moves too slowly. No, we must drop down again. Two hundred yards from the village, and *now* we get it. Rain? No; sheets, buckets, gallons of icy water, hurled not down, but straight at us. I gasp and lower my head for a second or two, pulling the peak of my cap further over my eyes. I must look up here, though. The road narrows, and I pass between a high-walled barn on one side and a house on the other. A continuous stream from my cap peak is dashed sometimes across, sometimes into, my eyes. I hold on desperately to the wheel, daring only to look ahead at occasional intervals. We meet nothing. We are alone, in the teeth of the hurricane, and no one wishes to share the honours with us. We come to a stretch of road where I know we shall be tried to the uttermost, and we are. The 12ft. wall to our right concentrates the wind on the road; to the left only fifty yards of bare ground separates us from the sea. But a full spark and a slightly more open throttle prove equal to the occasion; indeed, as we descend a

slight dip further on I try the high gear, easing back the spark the least bit. It takes it well, but I cannot. The quickened pace lifts me through it too fast.

I Cannot Breathe or See.

I am beaten back from the steering wheel, my drenched garments held against me by a masterful wind-hand. I stand it a few more yards, gasping and quivering, but I cannot look up. My eyes will not open against this awful flying river. I must come down to the low again. I feel blindly for the lever, and push it forward once more. Ah! What was that? A miss, and another. Missing badly, and two miles to go. The water has beaten through and round me. I am sitting in a cold bath. It beats from the footboard backwards. It has reached past me and my waterproof rug, to accumulators, coil, carburetter, and engine. No wonder it is missing. Still we stagger slowly forward. Splash! through pools three inches deep all lashed up by the savage downpour. That last puddle bothered us. We might as well be running through the sea. Miss! miss! miss! Shove forward that spark a bit and close down the air just a trifle. It responds gamely, fighting against the miserable wet that swamps its vitals. Thank Heaven, here is a three hundred yards' stretch between high trees where we are sheltered ever so little from the stress of the gale. Good! It takes the high gear without a knock. I can stand the pace here, but wait till we reach the worst bit of all, on the other side of this wood. Open country between us and the sea, a slight rise in the road, the full fury of the storm, and—here we are.

The Full Force of the Gale.

Now, little Rexette. You'll want all your six horses here. I dash from shelter, and, still on the high gear, come full up against—a solid wall; a cruel, cutting, face-smashing wall of hail. I grab the lever just in time, and we forge slowly into it on the low gear. Miss! miss! I huddle back, holding up one arm to protect my face against this wicked, stinging ice. I can't see where we are going. I can't breathe. I can only feel. I must stop, and run for shelter. No! By gad, I won't. As long as the car goes, I will hang on to it. With head down I can still give an occasional glance to either side to keep her straight; and I know the road. But this hill in front; will it take it? Slowly we struggle on. I retard the spark, and this helps it. That last gust was almost too much for it, though. The curving front seat acts as a scoop for the furious wind, and it is full of hailstones. Slower. Slower yet. No, we can't do it. We are thrashed to a standstill. Wait though. By Heaven, it's stopped missing! But we are barely moving now, and I am numbed and crushed. My breathing is a mere sob, thin and gasping. Five—ten—twenty—fifty yards further, and not beaten yet. Thump! thump! thump! I daren't slip the clutch, it'll never pick up again. Hang on! hang on! Up towards the crest—up—up—and now, by the Lord Harry, over it! Hurrah! Well done. I'll give your chain an extra good soaking in tallow to-night, so I will. We are on the level, and defying the gale once more.

Who is this poor creature ahead, her skirts blown back, her umbrella blown inside out, and herself blown

Through the Gale on a Tricar.—

to a veritable halt? Surely no one but my friend the post "man" of the neighbouring village would be out to-day. Yes, there she is, holding on to her leather bag like grim death. She cannot hear me coming, and I pull up on reaching her, motioning dumbly to the front seat. She climbs in, thankful for the lift, though it will be but for half a mile or so. Now we sail down hill, and the gale, as if finding itself beaten

and defied, slackens, and the hail, too, ceases from troubling, though a sullen rain still lashes us. I stop at Mrs. Maxwell's door, and my passenger alights and trudges off. I cover the tricar as well as I can, and emergency case in hand, I knock for admittance.

"Oh, it's you, Doctor. I never thought you'd have come to-day. John was in the town this morning, and only called in to ask you to come in when you were passing to vaccinate the baby."

H. S. G.

Has the Tricar a Future?

By B. H. DAVIES.

AS an ardent tricarist of more than five years standing, I hold fairly strong opinions on the tricar question, and as there are a good many motor cyclists who are loth to see it die, I should like to contribute my quota to the discussion. I consider we have seen three main types of tricar, and from their histories and failures we may compile some useful pointers as to the future.

The 1903 Type.

The 1903 type was that launched on the market with the $3\frac{1}{2}$ h.p. air-cooled, single geared, belt-driven Phoenix Trimco as a vanguard. I drove two or three of these, and I found they had only one failing, and that a serious one—they could not take two passengers up quite insignificant hills. They were comfortable, they were amply served by $2\frac{1}{4}$ in. tyres, and the standard of their reliability is identical with the reliability of the $3\frac{1}{2}$ h.p. bicycle, to which any owner can affix a forecar. If a forecar were fitted to a $3\frac{1}{2}$ h.p. motor bicycle of good make to-day it is only in hill-climbing that it would be unsatisfactory.

The 1905 Type.

The 1905 type consisted of a special frame, unsprung astern, but sprung forwards in some instances, and carrying a separately sprung chair for the passenger. The engine was water-cooled, and transmitted its power by a two-speed gear and chains. Samples of the type were the $4\frac{1}{2}$ h.p. Riley and $4\frac{1}{2}$ h.p. Humber. These tricars had three serious defects as a class:

- (1) Excessive vibration to driver.
- (2) Excessive frequency of minor troubles, due solely to vibration.
- (3) Front tyres too small for their work (2 in. or $2\frac{1}{4}$ in.)

The 1906 Type.

The 1906 type includes the big twin-cylinders of 9-12 h.p., with a gear box affording three speeds and reverse, frame sprung fore and aft, and a complete coach-built body. This type has one constructional defect and one practical defect, viz.:

- (1) Complete loss of steering control when back tyre bursts.
- (2) Cost equal to that of a small car without a car's sociability.

From these experiences I deduce the following conclusions about the tricar of the future:

1. It must not cost more than £80, or possible purchasers will prefer a small car, either new or second-hand.
2. It must not have a sprung rear frame. Hundreds of ex-tricarists have experienced a burst back tyre with

these frames, and do not intend ever again to find themselves seated on a motor going at thirty miles an hour and refusing to answer its helm.

3. It must be able to climb normally stiff hills.

4. Its specification must incorporate all the advances the last two years have introduced into standard motor bicycle practice.

A Suggested Specification.

From these deductions a specification is easily arrived at, somewhat as follows:

Engine.—5 h.p. air-cooled by enclosed fan, or water-cooled by thermo-syphon (pumps are too expensive and too troublesome).

Frame.—On no account rear sprung. Either sprung amidships with hinge *à la* Zenith, or sprung in front and rear seat sprung separately on a rigid frame. Open frame.

Drive.—Gears and chain. No reverse needed.

Weight.—3-4 cwt.

Price.—£60-£80.

Ignition.—High tension magneto, with geared starting handle (the old tricars would still be popular had they possessed this combination).

Brakes.—The brakes of the old tricars were, without exception, very poor. A 1909 tricar should have an emergency brake consisting of an expanding metal to metal in the rear hub. As this wears too fast for ordinary use, the main brake should be of a self-adjusting, wear-resisting pattern, *e.g.*, belt rim shoe on belt rim spoked to rear wheel on opposite side to sprocket. Front wheel band brakes are no use unless the drums be about 1 1/2 in. x 2 in., *i.e.*, twice as large as any ever yet sold as standard.

Tyres.—Rear wheel, 26 in. x $2\frac{1}{2}$ in. or 3 in.; front wheels, 26 in. x $2\frac{1}{2}$ in. 2 in. tyres are just big enough for the front wheels of a detachable forecar weighing 160 lbs., but vibration is less with large tyres.

Steering.—Direct, which is perfectly safe up to thirty miles an hour, and much the cheaper to manufacture.

One point more: Thanks to the failings of the early tricars, there is an immense prejudice abroad against tricars. This can only be killed if an annually increasing number of riders regularly drive a perfected machine, and have pleasant experiences with it. The makers have sinned too heavily against the public to be readily forgiven, or to be forgiven at all on the strength of a brilliantly written catalogue. The public is excessively suspicious of the tricar at present, and will need a lot of convincing.

This issue of *The Motor Cycle* is published one day later than usual to enable us to include a full description of the Tourist Trophy Race.

A word in season

The merit of the Roc lies in its comfortable low build, the Rider's feet easily approaching the ground. In its sound and strong duplex frame design the Roc is in a class apart. The Roc, with its 50 per cent. reduction on low gear, is the ideal for use with sidecar. The Roc free back axle, with pedal operated clutch and two speed gear, makes riding a luxury. The inclusive price of the Royal Roc 4 h.p. military model with ball-bearing engine and other features distinguishing this machine is 48 gns.

Roc magneto plugs	4/6
Roc adjustable pulley	15/
Roc magneto cut-out	2/6

Write for new fully illustrated pamphlet to the Sole Manufacturers:

If you already possess a serviceable machine it is good advice to send it to us now for conversion to the Roc clutch and speed gear system. The inclusive charge is 10 gns.

For use on greasy roads the Roc system is a real boon and comfort.

Note: Any belt-driven machine is eligible for the Roc conversion.

Motor Cyclists would be inveterate users of

The 'Stratex' Belt

(Berisford's Patent)

if they only knew how good, durable, efficient, and economical it is.

BROOKS Anti-vibratory Seat has patent compound compensating springs and is luxuriously easy with absolute freedom from vibration.

HERE ARE SOME OF THE ADVANTAGES OF THE "STRATEX."

No belt fastener—therefore no breaking at the fastener, no gap, continuous drive; it grips all the time. No slipping in wet weather. Increased Engine Power through perfect transmission. Worn section easily replaced—ensuring uniformity of size, shape, and driving surface. Great flexibility, durability, and economy. At the Bocardo M.C.C. (Oxford) Hill-Climb, the fastest time was made by Mr. H. G. Hill, who used a "Stratex" Belt, which had already run over 2,000 miles—a good test of Efficiency with Reliability. Ask for the M.C. list

BROOKS SPRING SEAT.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex

SECTION IX.

Somerset, Devon, Dorset and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

THE

PREMIER.

Agents for TRIUMPH, BAT, N.S.U., REX, ROC, BROWN, VINDEC, MOTOSACOCHE, F.N., and other BEST makes. Delivery of TRIUMPHS in seven days. Most other makes from stock. The best selection of New and Second-hand machines in the kingdom.

Exchanges.

WRITE FOR LISTS.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.

Telephone: 4310. Telegrams: "Primus," B'ham.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20 Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard this silence as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE

SECTION I.

Northumberland, Cumberland, Durham and Westmoreland.

EXCELSIOR, 2½ h.p., in first-rate order
£12.—A. Paget Steavenson, Hurworth
Darlington.

N.S.U., 1908 3½ h.p., magneto, two-speed, a new, also Montgomery sidecar; £30 lot
—Smith, 62, Sandringham Road, West Hartlepool.

PERFECT Twin Ariel without engine, coil carburetter; exchange for single or twin; cash adjustment; or will buy engine.—Barrett, Barrow.

NEW 3½ h.p. Brown, magneto, spring forks and seat-pillar, Roc clutch and two-speed gear, handle-bar control; £40, or exchange for good cob and trap, or anything useful.—C. Storey, Richard Street, Hetton Durham.

5½ h.p. Twin Chase, 100 miles since re-bushing and overhauling, handle-bar control, variable Greenwood, two puncture proof bands each wheel, tyres good, spares etc., etc.; £25.—Timmis, 31, All Saints Road New Shildon, Durham.

SECTION II.

York and Lancashire.

3½ h.p. 1906 Rex, spring forks, good running order; £13.—28, Dock Street, Leeds.

2½ h.p. Minerva, girder forks, engine first class order; £11 10s.—28, Dock Street, Leeds.

2 h.p. Minerva, girder forks, good running order; £6 10s.—28, Dock Street, Leeds.

2½ h.p. De Dion, Chater-Lea frame, long handle-bars, good hill-climber; £12.—28, Dock Street, Leeds.

TRIUMPH, 1908, bought August 15th, ridden three times; £44 10s.—56, Gathorne Terrace, Leeds.

1908 Magneto 3½ h.p. Rex, practically like new; £20.—C. Clarkson, 28, Parkinson Lane, Halifax.

1908 Triumph, in grand condition, done about 2,500 miles; £37.—Cross, Jeweller, Rotherham.

3½ h.p. Humber, as new, spares for everything; £16.—Birchall, Tower Buildings, Old Road, Bolton.

MOTOR BICYCLES FOR SALE.

SECTION VI.

Gloucestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

1. p. Twin Antoine (magneto), in first-class condition; £24, or near offer.—Ciculus, Dimery, Wormelow, Hereford.

h.p. 1908 Triumph, magneto, Palmer cord tyres, horn, and tools, in good condition; £38.—L. Kinchin, Park Road, Litch.

IN Rex, 1907 (November), magneto, footboards, several additions, new; cost nearest offer to £27 accepted.—R. h. King's Norton.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, and Channel Islands.

h.p. Minerva, 1908, as new, not ridden 50 miles; £27 10s., or near offer.

h.p. Quadrant, magneto ignition, 1907, hardly used, perfect condition, head, separate generator, bell, horn, Brooks seat, cut-outs; a bargain. £32 10s., or near offer.

h.p. Excelsior, surface carburetter, Palmer back tyre, Clincher front, in good order; £8, or near offer.

h.p. De Dion Car, seats four, in good running order, lamps, tyres in good condition, genuine bargain; sale or exchange, £30, or near offer.

6 h.p. Stirling Panhard, horizontal engine, dogcart body, three speeds and reverse, brand new gears, lately painted, as new, wheel steering; sale or exchange, £25, or near offer.

h.p. Rover, 1907 type, seats four, splendid order, hood, screen, lamps; £170, or offer.

h.p. Werner; £5.

See above cycles are to be seen at W. J. Randall's Garage, 3, High Street, And.

LIGHTWEIGHT N.S.U., new, spring forks; 32 guineas.—N. Fairbank, Bulford Camp,bury.

h.p. Rex, spray, trembler, good condition, Palmer back; £10.—53, Rosebery Avenue, Gloucester.

h.p. De Dion, Chater-Lea frame, good condition; bargain, £6 10s.—Firger, Botley, Hants.

h.p. Roc, magneto, spring forks, lamp, horn, stands, complete; £19.—53, Rosebery Avenue, Gloucester.

IRY Motor Cycle, nearly new, not been ridden 150 miles.—Apply, W. Rossiter, South Road, Kingswood, Bristol.

R Sale, N.S.U. lightweight, magneto, splendid condition; bargain, £25; or going abroad.—King, Lynchford Road, Abingdon, Hants.

VIN Minerva and Sidecar, spring forks, accumulator, adjustable pulley, all extra good tyres; £28.—Dr. Steven-Berkshire Hospital, Reading.

7.—John O'-Groat's 3½ h.p. Rex, flies on level, weak on hills, wants tuning up; money order has it.—Mack, 7, Wiltshire Street, Southsea.

h.p. twin-cylinder Brown Magneto Motor Cycle and castor wheel sidecar, in very good condition, three very good inner cord tyres, back wheel non-skid, line head lamp, handle-bar control, engine clutch, extra strong Watawata and spares.—K. Lambert, Mandora Works, Aldershot.

SECTION VIII.

Bedford, Essex, Middlesex, Surrey, Kent, and Sussex.

N., 1908, four-cylinder, new May last; £35; owner bought car.—Below.

N., 1907, four-cylinder, in thorough working order, lately overhauled; £24.—

h.p. Kerry, 1904 type, in perfect condition; £12, or offer.—The Hulbert-Murray Motor Co., 96, Upper Richmond Road, Putney.

Impressions of the 1908 T.T.

THE 1908 Motor Cycle Tourist Trophy Race cannot for several reasons fail to impress itself forcibly on the minds of those who have the best interests of the pastime at heart. Firstly, there were a record number of entries for it, since in this direction they equalled the Four Inch Race, the entries for both numbering the same; secondly, it was a great success, and how much can be learned from it we shall shortly show; and, lastly, it was totally devoid of any serious accident. The controlling of the speed by the limitation of the fuel supply works exceedingly well in the case of a motor bicycle. Marshall's average was forty and a half miles an hour, and in view of the very small number of mishaps there is no reason why the race should not be held in the Isle of Man next year. The course is eminently suitable, since, being hilly, it adequately tests flexibility, hill-climbing, reliability at high speed, and incidentally tends towards economy. This year most of the machines started with much greater ease than last year, proving that valuable lessons have been learned in this respect. On the next occasion on which the race is held we should suggest the same fuel allowance—1 gal. 4 pts. 13 ozs. for the singles and a slight increase over the 1 gal. 7 pts. 16¼ ozs. for the twins—as the majority of the latter were not able to acquit themselves sufficiently well on the amount of petrol allowed to them. As a contrast to this, Clark's four-cylinder F.N., which had 58 ozs. of fuel

left over at the end of the race, might have done marvellously well if its rider had known the exact amount of fuel he had left whilst riding. Here an improvement might be made, and the ingenuity of motor cycle designers should be exercised with a view to constructing a gauge, float, or some other kind of tell-tale which would show how much petrol the rider has left while actually driving at high speed; Marshall, McMinnies, and Franklin could also have done much better. Marshall's performance was really splendid; he and C. R. Collier had a magnificent fight, and the greatest credit reflects on them both.

Taking it as a whole, the organisation was excellent except as regards the sealing. In several instances thin brittle iron wire was used, which, as will be seen from the results, broke in many cases, and in one instance led to a dispute, which was not pleasant to listen to.

The Organisation.

THE officials all worked with a will. As judge, Mr. A. G. Reynolds worked as hard and as energetically as ever, while Mr. Robert Todd, the chairman of the Club, also devoted the whole of his time during the event in that capacity. As chief marshals, Messrs. R. D. F. Paul and J. K. Starley did much towards the success of the meeting, while others who did most excellent work were Mr. F. Straight (secretary), H. G. Cove, J. W. G. Brooker, A. S. Blanch, H. C. Ebbutt, S. W. Carty, W. Pratt, H. Fear, J.P., G. F. Heath, and G. Todd (marshals).

Mr. F. A. Hardy made a most efficient press steward, while the timekeeping was in the able hands of Messrs. A. V. Ebbelwhite, C. P. Glazebrook, and F. Straight, assisted by Messrs. J. S. Mallam and R. A. Tyler. The stewards, who lent valuable assistance, were Messrs. J. R. Gissing, A. E. Dendy, E. J. Chapman, and E. L. Bates, while at the weighing and examination of the machines Mr. J. Lyons Sampson gave invaluable help. An excellent point about this year's race which we have not yet mentioned is the success of the amateur riders. In the single-cylinder class that popular sailor, Captain Sir Robert Arbuthnot, R.N., while waiting for his new ship, the *Lord Nelson*, to be commissioned, took third place, while Mr. W. H. Bashall, another amateur rider, came in second in the twin-cylinder class. As matters at present stand the trophy is not capable of being won by a multi-cylinder machine, but we sincerely hope that next year's regulations will allow it to be won by the first machine past the post irrespective of the class to which it belongs. This, we are sure, was the original wish of the donor. We would draw attention to the fact that both last year and this year a single cylinder machine accomplished the fastest time. In conclusion, we should like to express our hope that such a fine event as the Motor Cycle Tourist Trophy Race will long continue to be an annual affair.

The winner and his Tourist Trophy Triumph immediately after the conclusion of the race.

THE TOURIST TROPHY RACE IN THE ISLE OF MAN.

Fixing the numbers on the competitors' backs.

Filling up the tanks with the precious spirit.

We have received a small sample of gear grease called Vasoleum, and sold by the County Chemical Co., Birmingham, who will be pleased to send a sample for trial to any reader who applies for it.

Riders who experience the same difficulty as Mr. Whaley, who wrote on September 16th regarding the re-tailing of small quantities of petrol in the city, should make a note that just outside the city boundary is the Service Motor Co., who keep a stock of petrol at their premises in Featherstone Buildings, High Holborn.

Judging from a series of testimonials which we have had sent to us, the new lightweight Wolf is quite a reliable machine. Up to the present we have not had the pleasure of riding one of these machines ourselves, and therefore cannot speak of it from practical riding experience, but the copies of testimonials sent for our perusal are from riders all over the country, and in some cases in the Colonies. We understand that the Wolf set will suit any strongly built roadster bicycle, and as it is sold at a very reasonable price it should shortly become very popular.

THE TOURIST TROPHY RESULTS AT A GLANCE.

Single-cylinder Class.

Rider.	Machine.	Bore and Stroke.	Time.*	Average Speed.	Petrol left in Tank.	Remarks.
		mm.	h. m. s.	m.p.h.	ounces.

A SPRING SIDECAR.

THE increasing popularity of the sidecar has set many minds to work on the introduction of improvements, and the feature illustrated appears to be a decided step in that direction. It is the invention of E. A. Crowsley, of 167, Victoria Street, London, S.W., and consists of an arm pivoted on the axle tube of the sidecar. The side wheel is carried on one end of this arm, and at the other end a spring is arranged. The design of the spring may be as shown, with the springs in tension, or the springs may be arranged below the frame and in compression, or the two styles may be used in combination. The springing can be adopted when used with a spring or rigid framed bicycle. An examination of the picture shows that the hub is screwed for a brake drum, and the machine will be so equipped. A similar drum will be fitted to the bicycle rear wheel, and the two operated by one lever with a compensating device introduced. The fittings for the brake are all mounted on the spring arm, which also carries the mudguard, so that there is no alteration in the relative positions of these parts.

A spring sidecar, the subject of a recent patent.

The Hill-climbing Question Reviewed.

By B. H. DAVIES.

THE correspondence on this question has brought three facts into high relief, viz.:

1. That there is great heart-burning among amateurs about special machines.
2. That the majority of machines entered differ from standard practice in details more or less important.
3. That the existing regulations are too lenient, and allow such a machine as McMinnies's racer to be pitted against standard tourist roadsters in all honesty, and without straining the rules.

No other solution of the difficulty has been offered, other than my own notion of employing a disqualifying engineer, and using his services to confine all special machines to a special class.

The Factor of Weight.

I now wish to emphasise the matter of weight. A reader signing himself "H.M." rather unfairly misrepresents my statements, and makes me allege that it is owing to weight reduction that the special machines win. It is true that I named weight as a factor, and that it is a more important factor than many people suppose, but the real root of the evil is undoubtedly the special engine. It is the special engine that wholly puts the amateur out of court, and other details, such as cutting down weight, using small, thin, smooth tyres, special carburettors, special fuels, etc., merely complete his discomfiture. But the weight question will stand emphasising, and in this article I intend to emphasise it. Some months ago Mr. S. F. Edge sent down a big Napier racer to Brooklands Track, with a tailboard in the form of a big shallow tray. A number of large iron ingots were provided, and the car was tested against the watch with varying numbers of ingots carried in the tray. The times proved that the addition of a heavy weight to the load scarcely slowed the car at all in flying sprints on the level, but that the presence of the extra load had a very perceptible effect in retarding the acceleration of the car from rest, and this effect is naturally most of all marked when the acceleration is performed on a gradient. Now if "H.M." and other readers will consider the matter, a motor cycle hill-climb is nothing more or less than a refined and complicated weight lifting competition. Each competitor is provided with a restricted amount of mechanical energy, with which he has to lift a certain weight to a certain height in the shortest possible time. The amount of energy is fixed, because he may not exceed a certain bore and stroke, but the illogical part of the conditions is that the weight is not fixed. Hence the cuter entrants do their best to cut down the weight to the absolute minimum. Every entrant has two points to aim at under present regulations: the first to get the maximum amount of power out of the fixed engine dimensions; the second, to reduce the load he has to lift with this fixed amount of energy. In a flying start hill-climb of short duration the 30 lbs. or 40 lbs., which is all he can jettison, makes little difference; but in such a hill as Birdlip, Newnham, and Sutton Bank, with a long climb on a steadily rising gradient, culminating in a lengthy stretch of 1 in 8 to 1 in 6, every 5 lbs. will show its presence on the watch. Consider Class IV. in the recent Coventry M.C. climb. There was only 12s. between the first man and the seventeenth man; it is at least possible that if the first man had

carried an extra 3 stones of weight he would have been seventeenth instead of first; and probably as the first man rode a T.T. racer, he actually carried about 50 lbs. less than if he had ridden a standard roadster of the same make in full touring kit.

Fixing a Minimum Weight.

The regulations of every "roadster" hill-climb are framed to prevent weight reductions; it is for this purpose alone that motor cycle metal mudguards, roadster motor cycle tyres, and other touring appurtenances are specified. A much simpler and surer method of attaining this point would be to fix a minimum weight for each class except the racing class. This method was tried at Fernhurst in 1905, where practically every competitor was loaded up with sandbags; in fact, I carried one myself in that climb, though I was mounted on a standard roadster, and I weigh 13 stones. The method was afterwards abandoned, partly because of the trouble of providing bags and sand, and partly because some competitors objected to lashing them on to the machines. Let us suppose future regulations contained a clause saying, for instance, that every $3\frac{1}{2}$ h.p. must scale 160 lbs. at the weighing in. An empty canvas bag could be sent to each entrant with his acceptance, and he would be told he was held responsible for bringing his machine to the scales at the proper weight. He would err on the safe side, and bring an excess of sand. Arrived at the scales, his machine would be weighed, the officials would untie the bag, and scoop out sand till the minimum was touched. The organisers would incur no extra trouble or expense beyond the provision of returnable bags at a trifling cost, and the whole evil of weight reduction would be killed by this one stroke. If the bags are properly made and attached there is no danger to competitors in carrying the extra weight on the machine. I should prefer, personally, to see riders' weight considered as well, and the minimum weight, say, for a $3\frac{1}{2}$ h.p. to be fixed at 160 lbs. for the cycle and 11 st. 7 lbs. for the man. This step alone would even up matters tremendously in standing start events, and if disqualification by a properly qualified engineer accompanied it, we should see amateur classes or roadster classes won by real amateurs on real roadster machines.

Weight and Public Demand.

This step would have no arresting effects on motor cycle development from the weight aspect. One or two makers have brought down the weight of the standard single-cylinder roadster to 160 lbs. without any other inducement than public demand. It is not hill-climbing competitions alone that urge weight reduction on the industry; popular outcry, the Tourist Trophy Race, and all open speed events serve the same object, and even if we fixed a generous weight minimum for amateur or standard classes in hill-climbs, we should still have public demand, the T.T. Race, and the open classes in hill-climbs to keep low weight before the eyes of the industry as a valuable desideratum. In the very near future, there will be the added competition of 80 lbs. machines, threatening the very existence, maybe, of present day standards of weight. Riders who have tested the best modern lightweights, as I have done, are beginning to realise the 80 lb. roadsters may soon be as serviceable as the 150 lbs. machines.

A Tricar Tour in Cuba and Florida.

ALTHOUGH we have owned a car for six years and had many pleasant rides, much more pleasure has been derived from our little tricar.

At one time I did not see how anyone would be able to ride on a motor bicycle, for all the motor cyclists we met on the road were besmeared with grease, the leather clothing was covered with dust, resembling an engine-room hand on an ocean liner whose duty it is to see that the bearings of the propeller-shaft are kept cool and who has neglected to wash after the last voyage, and, besides, motor bicycles are so noisy. When my husband returned from the Florida Beach Races it was plainly seen that an automobile had seen its best days.

On Sunday mornings he did not want to take it out, and after dinner it was nearly dark before it was ready or he made me excuse to avoid a run. When we did get started it required so much attention that the pleasure was lost. Having plenty of spare room in our garage, a friend left his tricar, with permission for us to try it.

I Tried the Seat.

It was a delightful day, and just as we were about to start our car a valve blew out, which meant two hours' labour to get the valve for a few seconds' pairing. We both looked at the tricar. My husband inspected the contents of the tanks; there was oil and petrol, and the rear wheel jacked up. He switched and pedalled the engine over, and it immediately went off like a Gatling gun. I tried the seat (to my surprise it was comfortable), but with the thought of what the neighbours would say

and the attention we might attract, rather than lose the afternoon's ride I told him to see if the road was far and "get away" just as soon as possible. Before the afternoon was over we jointly decided an Indian tricar would suit us, and the order was placed the next day. Although sceptical at first, I was soon convinced of its capabilities and the extreme ease with which one travels over rough surfaces without jolts or engine vibration. On a level surface the motion is not unlike sailing on absolutely smooth water. The maintenance is much less in proportion than that of any small car, and it serves the same purpose on good roads. But who wants to ride for pleasure on bad roads?

Another advantage is the small amount of care necessary to keep it in readiness for immediate use. The fuel tanks full, with an occasional glimpse at the chains and batteries, it seldom refuses to "mote."

Moderate Expenses.

Placed in a crate, our little tricar was carried from New York to Ormond, Florida, for \$5.90 (25s.) where we made a stop of two weeks, during which

time we rode on all the roads in the vicinity which were rideable for any motor-driven vehicle, and on the famous beach with one twenty miles straightaway run our cyclometer showed some six hundred miles. The garage charges were nil, having run it under cover only when the weather was wet, and other times leaving it on the drive. Total consumption about ten gallons of petrol.

From Ormond, Florida, it was freighted three hundred miles south to West Palm Beach at a cost of 18s. 6d., where it was uncrated and the empty crate shipped to Miami for 3s. But our hopes were shattered when we were informed that nothing but

A bad place for a sideslip! The road is twelve feet wide, and flanked on each side by deep water.
Near Fort Lauderdale, Fla.

"nigger mobiles" (as I have heard the coon-pushed wheel chairs at Palm Beach styled) were allowed on the beach.

Here we perforce had to leave motoring alone for several days. We enjoyed a motor boat carnival. The road from Palm Beach to Miami is made of pure lime rock, and on the straight stretches reminds one of a silver white ribbon laid through the tropical verdure of the land of flowers. So narrow is this road that were one to meet or attempt to pass another vehicle, it would require much care to avoid an accident. For several miles there is a ditch on both sides of the road, the latter being only 12ft. wide. We much regretted this road was not longer, as the sixty-six miles were quickly covered. The scenery was grand, and it was new to us to see convicts working on the roads guarded by a typical Southern sheriff with his never-failing Winchester across his arm and a brace of vicious-looking bloodhounds by his side.

We had three days to wait before the steamer left for Cuba, so we stored the crate, giving a negro Stevedore some loose change to keep it until wanted. Two gallons of petrol was the expense here. We were not

A Tricar Tour in Cuba and Florida.—

long exploring all the least resemblances of roads, but what a figure we did cut. Everybody wanted to get a look at our machine; one would have thought a circus was in town. Wheeling it on board the steamer, we had it registered to Havana, and it must have made the owner of a \$750.00 runabout green with envy. His car cost him \$25.00 freight and \$7.00 counsels' fees each way, and then we met him on the road in Cuba, only to speed by him with a smile.

We traversed all the good roads of Cuba in the neighbourhood of Havana as far as San Christobal and Muiriel, making several trips to Guanajay, and inspected the international automobile course. The riding here is said to be better than in Europe, and the scenery is grand. Here and there, scattered along the road, are the historic Spanish block houses, pineapple fields, banana groves, and coconut palms. It is hard to realise that one is in a place so foreign only ninety miles from the United States and with absolutely no speed laws. However, one must be a careful driver, for Cuban traffic is strange compared with New York.

Traffic Dodging in Havana.

Fifth Avenue on a pleasant afternoon when congested with horse-drawn vehicles is an easy task for a tricar driver compared with the Prade of Havana. Though this thoroughfare is wide and divided in the centre by a park, the Cuban driver of any vehicle forgets there is another soul in the world but himself. He drives his horse zigzag, turns out to left or right as his fancy may select, and observes not the smallest rule of the road. The same shiftless custom is followed by all on the Cuban turnpikes from the ox-cart moving at three miles per hour, with the driver asleep on the seat, to the "wah-wah" going as

speedy as a horse-drawn carriage can travel. Most of the pedestrians in Havana are more careful than an "Americano" in crossing the streets, and a touch of the bell which all vehicles carry causes a rush to a place of safety. It is said that there are 8,000 ca

Native Cubans by the roadside.

in Havana, and the drivers are always looking for "fares" or disturbing pedestrians by clanging the bells.

It was said that when the electric tram was first introduced into the streets of Havana it was necessary to smash many vehicles before the horse drivers would give way to the cars. Now they keep at a safe distance, and jump at the warning of the motorman like a dog bolts at the report of a gun after once having been wounded by a stray shot. Let us hope the Cuban people will soon realise the importance of observing the rules of the road, and then it will be a pleasure to tour with a tricar and enjoy the tropical trips and scenery of the "Pearl of the Antilles."

JEANETTE DONALDSON HASTINGS.

SOME USEFUL ACCESSORIES.

Hunt's Stores, Ltd. 104, Newgate Street, E.C., have lately devoted their attention to catering for motor cyclists, and have succeeded in placing before the motor cycling public several accessories of no small interest. Perhaps the most attractive of these is a mirror working on a ball joint, specially designed to be attached to the handle-bars of a motor cycle. Another useful accessory is a lamp bracket for attaching an extra lamp to the handle-bar, and while dealing with the question of lamps it is interesting to note that Hunt's Stores, Ltd., are making a speciality of an extra heavy acetylene generator of sound design. It is carried on a powerful bracket, and is also provided with a two-way tap for two lamps if necessary. Other lamps which can be obtained from these people are a lens mirror lamp, the Alpha (B.R.C.), and the

Autoclipse. Box spanners suitable for motor bicycle work can also be obtained from the same address. Motor cyclists in want of anything for the motor cycle would do well to write for the firm's catalogue or call personally at 104, Newgate Street.

An advertiser in an announcement regarding the repair of accumulators recently stated that "Minerva accumulators cannot be repaired," meaning thereby that, as he was interested in another make, *he* was unable to undertake the repair of Minerva accumulators. It has been pointed out that some of our readers might think that it was impossible to repair Minerva accumulators. This, of course, is not so, and this make of accumulator is as easily repaired as any

An Examination and Report of the Douglas Engine.

A SHORT time ago Messrs. Douglas Bros., Kingswood, Bristol, forwarded to us for examination and report a twin-cylinder engine which had been used on the Douglas motor bicycle ridden by Mr. Eli Clark in the A.C.U. Land's End to John-o'-Groat's trials. This machine practically completed the trial, as it arrived within a few miles of John-o'-Groat's, and after the trials was ridden in the A.C.U. Land's End to Plymouth and back twenty-four hours run (gaining the silver cup in its class), and then home to Bristol by road. We dismantled the engine and examined all the parts carefully, and find the two cylinders, which are 60 mm. bore, are in excellent condition, the difference between the diameter at the top and bottom of the cylinder being only about one-thousandth of an inch. The piston rings are very little worn, and there is very little play on the big ends, and practically none on the gudgeon pin bearings. The fastenings for the gudgeon pin, which consist of a split pin through the lug of the piston, also bedding in a keyway cut in the gudgeon pin, show no traces of having moved, and the cotter pins are not broken or bent. On the piston there is a fair deposit of carbon, the front piston having more deposit than the back one. Neither of them, however, shows anything above the normal, considering the distance the machine has been ridden. There is practically no wear on the crank axle, which is in perfect order. The last drive to the magneto shaft is exposed on this machine. The gear, nevertheless, is in good order, and is not worn; neither does the magneto armature shaft show any appreciable signs of play except the slight end movement, which is usual with these bearings. The inlet and exhaust valves show slight traces of over-lubrication, the inlet valves being rather foul and the wear on the washers at the top of the stems is considerable, *i.e.*, the inlet valves

originally opened $\frac{1}{8}$ in., but they now open $\frac{3}{16}$ in. The exhaust valve faces are not pitted, but are ground slightly hollow.

The timing gear on these engines is rather inaccessible, as the crank case would have to come apart to get at the timing gear or cams operating

The Douglas 2 1/2 h.p. twin-cylinder opposed engine with automatic inlet valves.

the exhaust valves, although the tappets operating the exhaust valves can be removed with ease. Another little disadvantage in the way of inaccessibility is the fact that the cylinders cannot conveniently be removed from the crank base without removing the engine bodily from the frame. The cylinders are screwed into the crank base and locked with a lock ring.

Taking everything into consideration, the engine is in excellent condition.

The Acme 3 1/2 h.p. twin-cylinder V-type engine, with mechanically-operated inlet valves, the bore and stroke being 66 mm. x 70 mm. As will be seen from the drawings showing the end section and side elevation, the engine is of neat design. Its complete weight with Bosch magneto is said to be 48 1/2 lbs. Two Tourist Trophy machines were fitted with this make of engine—one entered by Messrs. Pellaux and Bibbie, the other entered and ridden by Mr. E. G. Young.

Letters to

the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Petrol Tin Stoppers.

[3570.]—Why have the firms who supply petrol adopted the very awkward means supplied for removing the cap from their cans? After "barking" my knuckles over obstinate stoppers on numerous occasions I have "longed" for the day when the caps will be so shaped that an 8in. spanner can be used. This is a method to which I can see no objection, as every motorist has a spanner included in his kit.

W.J.D.

To Ensure Easy Starting.

[3571.]—May I draw your attention to a fitment to ensure certain starting of motor cycles in all weathers and conditions. Remove from an old camera lens the Iris diaphragm and fit it underneath the mixing chamber of the carburetter. This when closed will cause a good supply of petrol to issue from the jet and ensure an easy start. It can be regulated by the usual lever or Bowden control from handle-bar. This acts in the same way but better than an adjustable air adapter. Why are there no fuses in the circuit of battery-ignited motor cycles? Look how many ruined cells it would save. I have always used a fuse.

SV 79.

The Standardisation of Motor Cycle Rims.

[3572.]—We are extremely surprised to read letter No. 3546 in your issue of September 16th regarding "The Standardisation of Motor Cycle Rims." If your correspondent "BD 552" will kindly refer to our printed list he will find that we make it a special feature to fit his particular rim (Clincher), and all such tyres are stamped "Special." We have supplied thousands of covers of this size, and this is the first time we have read of a complaint. It is evident that "BD 552" has got hold of a cover made for quite a different rim. The large variety of sizes made by us enables us to fit almost all existing motor cycle rims.

To correct the erroneous impression caused by "B.D.'s" letter, we ask you to be good enough to publish this letter.

THE HANOVER RUBBER CO.

A Good Climb on an Old Machine.

[3573.]—I thought that it might interest the readers of *The Motor Cycle* to know the excellent climbing powers of the Quadrant motor cycles. I have an old 1½-2 h.p. (2½in. bore by 2½in. stroke) machine of this make, surface carburetter, 6½ to 1 gear, weight of machine about 120 lbs., my weight 9 stones.

I took this machine to a hill in Chingford, Essex, known as Friday Hill, which has a gradient in parts of, I should think, 1 in 5 or 6. The hill is about a quarter of a mile long with a very sharp pitch at the top. The machine, with me up, climbed it at a good 12 m.p.h., which I think is an excellent performance for so small an engine carrying such a heavy weight (246 lbs. self and machine). I think the hill in question would tease a good many much higher-powered machines. Of course I did not assist with the pedals.

QUADRANT.

[Modern machines have a higher gear than 6½ to 1; that is why they do not always climb better or faster than some older patterns.—Ed.]

Puncture Repairing.

[3574.] — With reference to "Ixion's" remarks on "tacky" trouble in a recent issue, I would strongly advise all those who find it difficult to make a good repair job with the ordinary solution and patches to try a Patchquick outfit. Apart from getting the cover off, there is absolutely no difficulty in mending a puncture with these outfits, as the patches stick at once and never curl.

With regard to the belt controversy, I should like to say that during my earlier experiences as a motor cyclist I tried most of the leather belts, but found none of them really satisfactory. About two years ago I bought a Stanley Dermatine, and since then, apart from the inevitable stretching at first, I have had no belt trouble. A few weeks ago I bought a new one, and am now carrying the original one as a spare. My machine is a 3½ h.p. Quadrant, with ¾in. pulleys.

C. L. MASSY.

P.S.—I am not financially interested in the industry.

Combined Tool-bag and Holster for Starting Handle.

[3575.]—Some time ago I read in *The Motor Cycle* that a Rex Modèle De Luxe rider was wishing to know a way to carry his starting handle. I enclose you a photograph of my machine showing tool-bag and holster for starting handle combined. This was made for me by a local harness maker. The tool-bag is made to fit in the frame under the saddle, and the holster is strongly sewn on to the tool-bag. You will also see just at the back of the engine a triangular-shaped

piece of wire hanging from footrests to within about a quarter of an inch of the ground. I have found this very good for preventing nails getting into the back tyres. I was constantly troubled with nails, but since fitting this I have done about 2,000 miles and the tyre has not picked up a single nail.

B. G. DURKIN.

A Problem to be Solved.

[3576.]—I am afraid your explanation *re* exhaust lift at the end of letter 3500 will not hold water, because the extra air coming *via* the exhaust must be very foul, if, indeed, it is not entirely innocent of atmospheric oxygen. This

phenomenon shows itself in my own machine, which has a long exhaust pipe and a silencer whose cubical capacity larger than that of the cylinder. I should also like to your readers know my experience of benzol. I have now completed 6,000 miles on nothing else but pure benzol (prepared by Stainsbe and Lyons, Knottingley). I have taken in the engine every 2,000 miles, and have found absolutely nothing wrong. Every part as clean as with the best oil. My machine is just as easy to start as with petrol. Mileage has been increased twenty to the gallon, and have to try very hard to get my engine to knock now. Satisfaction is such that I can say without exaggeration were I offered a can of petrol and a can of benzol at same price I should certainly choose the latter. I have used a mixture of crude wood naphtha and benzol on car without any of the sooting, etc., mentioned in letter.

MEDICUS.

With regard to slight partial lift of exhaust causing an acceleration of speed we can only repeat that it has been my experience many times, and we have always credited to lack of air *via* the carburetter.—Ed.]

Belts.

[577.]—There has been a good deal written about belts. *The Motor Cycle* during the last two months, some contributors attempting to show the superiority of rubber and canvas belts over any other kind.

Four years ago I had a rawhide belt, and do not think I returned from a ride without the belt having broken. I did not know whether to give up motor cycling or experiment with belts, but I decided on the latter.

In order to give the belt makers a fair chance, I thought I should also supply the pulley, so I ordered a two-ply Watawata belt and pulley from Ormerod, Ltd., Rochdale, my 3½ h.p. Rex; they also sent me a book on "The Use and Care of Belts." I carefully carried out their instructions, with the following result: The belt was put on in June, 1906, taken off in July, 1908, not having broken once. I rode all the year round about three days per week, and in all weather, which has had no effect whatever on the belt. About three weeks ago I was riding for about nine hours; rained all day without ceasing. At the close of the ride had to negotiate a hill three miles long (some parts 1 in 5), the belt was still in good order. This belt I had carried on the head of the machine for twelve months without using it, and it was my desire to try this one that caused me to take the old one off; it is a three-ply ¾ in. Watawata. What make of leather belt or what attention one of your correspondents could have paid to his belt to call it "a pile of yards of slime," I cannot understand.

Perhaps my method of treating a leather belt may be of use to others.

About every two or three months remove belt, and with blunt knife scrape the grit from the sides, and with a piece of thin wood dislodge any dirt that may have got into the spaces between the rivets; brush well to clear away all dirt, then paint the belt on top and bottom only with linseed oil, leaving it all night in a warm room to allow the oil to penetrate the leather.

After riding several hours in the wet, the belt should be taken off and washed, using a scrubbing brush, wiped perfectly dry, hung up in a warm room for a few days to dry, and treated as above.

Although I feel greatly indebted to the makers for the pleasure derived through using their belts, my object in writing this is to give the benefit of my experience to others, that they may participate in the same pleasure. E.O.E.V.

An Interesting Magneto Transmission.

[3578.]—With reference to Mr. Walford's interesting article on the Gianoli magneto transmission. It is not clear how two eccentric pinions can be made to gear correctly.

The diagram shows the pitch circles of two eccentric pinions on axes $O O_1$. As shown, the maximum radius of the left-hand pinion is in contact with the minimum radius of the right-hand pinion at Q. The distance between the axes through this point Q should obviously equal the diameter of one of the pinions or Q R, but when, for instance, a quarter of the circumference of the pitch circles of pinions have geared and the points A and A_1 are in the same straight line as the axes $O O_1$, viz., at A and A_1 , then the distance between the axes should equal Q P or Q R

which is obviously greater than Q R, the original distance. Therefore, the pitch circles must overlap at this point. The difficulty is probably overcome by having the teeth of sufficient depth to allow for this. F. P.

The Lightweight Question.

[3579.]—Much has been written in your paper of late for and against the lightweight, inasmuch so that I feel it almost a moral duty, with your kind permission, to give your readers my slight experience.

Although knowing something of petrol motors for some years, having owned a car and more than one motor boat, strange to say until the last few months I knew absolutely nothing at all about motor bicycles; in fact, I had always regarded them as noisy, unsightly, uncomfortable, and dangerous nuisances, until a friend of mine was telling me one day that he had just seen the nicest and prettiest little motor bicycle he had ever come across, and whose owner was delighted with it. As I thought, it turned out to be a well-known 1½ h.p., and I chanced to meet a gentleman staying at an hotel in a neighbouring town just afterwards who had one of these machines, and fully imbued with that courtesy usually exchanged among the motoring fraternity, he very kindly rode his machine here and tried it up over the three hills out of this town. I was rather disappointed to hear him report that, although he was highly pleased with the performance of his little 1½ h.p., it was as much as ever he could do with hard pedalling to get up either of the hills, and even then he had to rest in the middle of each for a few minutes, and he frankly told me that, living in a valley such as this, he should advise me to have more power. I forthwith invested in a copy of *The Motor Cycle* weekly in quest of the next best thing in lightweights, and I saw an illustrated advertisement of a twin 2 h.p., which I thought would be just the machine I wanted, which opinion was confirmed upon my getting full specification from the makers. Even then I had grave doubts whether this machine would be able to negotiate this country roundabout, which is as bad as, if not worse than, any in Devon, the town itself being hemmed in on all sides by hills very nearly two miles in length and rising from sea level to an altitude of 500 to 600 feet, with twisting and irregular roads. Eventually I got the makers to send a

Tourist Trophy competitors lining up for the start at St. John's. This year there were thirty-six riders, last year only twenty-five.

machine here and demonstrate its possibilities, and I had my first ride on a motor bicycle, when I was so agreeably surprised that I there and then decided to purchase one. I have now owned one for two or three months, and have done about 500 miles on it over as bad a country as it could traverse, right across the heart of Dartmoor, and I am delighted with it in every way. It takes the hills with ease, and is simplicity itself to handle, and I can pay my little iron steed a very high tribute and say it is an ideal mount. I use a good oil, and am very careful about lubrication; it is very comfortable riding, and very easy to start and to manage in traffic. I have ridden it well over 100 miles in a short day on a gallon of spirit, and with the gradual opening of the throttle it purrs away across country like a little contented kitten. I think this particular make is bound to become popular, and deservedly. I have not had a puncture, nor has a nut come loose. I have suppressed names, as I have no interest in any firm, but I will gladly inform any reader the name of the makers.

Dartmouth.

J. D. HAWKE.

extent of, at the outside, 10%. For two-stroke engines the formula would become $\frac{C \times T}{.1V}$ plus one-tenth, than which

nothing could be simpler.

With regard to the practice of the Marine Motor Association of America, which, as you point out in your leaderette, is to impose a handicap of 50%, one has to remember that these marine motors are slow-speed water-cooled engines, and that in consequence the proportion of the stroke rendered ineffective is much smaller, and the mean effective pressure attainable is higher than in the case of the high-speed air-cooled motor of the bicycle.

I have written so far as a sportsman. By profession I am an engineer, and have been for the last two and a half years engaged to a considerable extent in the development of a new type of four-stroke engine (not two-stroke). I know by experience, therefore, what hard work is involved in bringing out a new engine, and how easily its mode of action, its limitations, and its advantages can be misunderstood, and I

The previous holder of the Tourist Trophy, No. 1, C. R. Collier (3½ h.p. Matchless), and the holder of Dr. H. S. Hele-Shaw's trophy, No. 2, H. Rem Fowler (5 h.p. Twin Norton), led off the procession in this year's race. Our illustration shows them as they were starting.

Two-stroke Engines and Formula in Hill-climbs.

[3580.]—In connection with your leaderette and the recent correspondence in your columns on two-stroke engines, there are two points which have so far not received attention, which appear to me to be of vital importance, and to throw considerable light on the question of handicapping. I refer to the comparative lengths of stroke and mean pressures of the two and four-stroke engines.

In two-stroke engines the piston during 15% to 23% of the stroke is functioning as a valve, so that on the average the effective stroke is fully 19% shorter than the mechanical stroke; in other words, in designing a two-stroke engine, after you have settled what length of stroke you require for developing the power, you have to add on a considerable length to provide for the uncovering of the ports. Hence, when the capacity of a two-stroke engine is estimated from the bore and stroke, the engine is at once handicapped to the extent of 19% on the A.C.U., or Professor Callender's formula.

Again, the mean effective pressure attained at the usual working speeds in a two-stroke engine of first-class design is from 37 to 40 lbs. per square inch, as against 60 lbs. in a four-stroke engine. On the other hand, the two-stroke engine has one working stroke per cylinder every revolution. Taking the average mean effective pressure attained in the two-stroke engine as 38½ lbs. per square inch we can compare the engines on the pressure and cycle questions by taking 77 lbs. for the two-stroke and 60 lbs. for the four-stroke engine, i.e., on this score we may fairly say the two-stroke engine has an advantage of 17 in 60, or 28%. Hence, the nett advantage of the two-stroke engine is 9%.

It is, therefore, obvious that all the requirements of sport would be met by handicapping the two-stroke engine to the

would, therefore, like to suggest that no action be hastily taken which might hinder the development of the two-stroke engine.

W. H. GLASER, M.A.

SUMMARY OF OTHER CORRESPONDENCE.

The Bat Motor Manufacturing Co. write: "We notice 'Ixion' in 'Occasional Comments,' September 16th, page 728, deplores the fact that up-to-date machines are not fitted with automatic lubrication. In this, however, he is wrong, and we would point out that the Bat is, and has been for the past year, fitted with the J.A.P. patent drip feed lubricator, which is quite automatic and perfectly satisfactory. The tell-tale is fitted right in sight of the driver, and an adjusting screw gives any desired feed."

EXPERIENCES WANTED.

Tam Pearce would like readers' experiences with the Clair silencer.

"W. T. F." would like readers' experiences of the Nala two-speed gear.

"Buckboard" would like readers' experiences with the engine fitted to the Orient Buckboard, particularly with regard to easy starting and the prevention of overheating.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

WELL I'm jiggered?
THEY'VE NOW COLLARED THE LOT!!

W/H.

OCCASIONAL COMMENTS.

By "IXION."

Improvements on Lightweights.

Several writers have lately spoken severely of the minor fittings of modern lightweights, and especially upon the flimsy nature of the wheels and tyres employed. I am authorised by several makers to say these points are receiving immediate attention, and that heavier wheels and tyres will be standard on two or three makes within a few weeks.

A Lamp Securing Tip.

I see many lamps tied on with copper wire or string, and riders tell me they are afraid to put a bolt clean through the clamp and the bracket tongue, because the clamp then usually snaps off short at the point where it joins the body of the lamp. A good tip is to make an S hook of stiff steel wire, of such a length that one end will hook round any convenient bit of the lamp on the side remote from the bracket clamp, while the other end hitches on to some part of the frame below the bracket. The point to watch is that the hook is taut when sprung into position. This clips the lamp at the opposite side to the bracket, and makes the friction locking quite secure and reliable.

Adjust Contacts with Engine Running.

I find there are still thousands of novices who adjust their contact breaker platina with the engine switched off. It is doubtful if even an expert will get the best adjustment three times out of four by this method, and there is no doubt at all that the novice is likely to sacrifice a third of his maximum engine power by so doing. Thanks to magneto ignition, this point is of far less importance than it used to be, but there are still thousands of accumulator-ignited machines about, which is my excuse for mentioning the proper plan. The three essentials are a level place, a fat friend, and a screwdriver. Put the machine on its legs upon the level place, put the fat friend in the saddle, and with the screwdriver make the platinum pointed screw advance

to and retreat from the blade, after the fat friend has started the engine up. It is best to test the setting with the spark two-thirds retarded, and tighten it up temporarily at the setting which makes the engine run fastest. Then advance the spark fully, and if there is no misfiring there is not much amiss with the adjustment.

Hard Lines!

We all realise that in every big trial a small percentage of riders are regularly thrown out by sheer hard lines. A trouble attacks them of that haunting sort which only befalls one rider in a thousand, and which perhaps only affects one machine of the makers' total outfit. Mr. J. O. M. Dixon was one example in the End-to-end, but he managed to rise superior to circumstances. Mr. T. F. Cox now sends me details of his own exasperating experience. Everyone who saw the early stages of the trial realised that Mr. Cox was in difficulties with his big twin-cylinder, and he now informs me that he was troubled with practically permanent misfiring in one cylinder. As a skilled rider he made every possible test and substitution, but without effect, and finally he was compelled to retire at Perth. When he got home he still failed to probe the mystery, and at last sent his coils to be tested; they were pronounced perfect. Finally, he was wheeling his machine backwards, some three weeks after the trial, when he noticed a grating noise proceeding from the distribution gear. He promptly dismounted it, and discovered that the arm of the bell crank which lifted the valve tappet had split lengthways. The split had gaped a little, and at times one arm of the split crank would bind against the side of the crank case, causing the tappet to stick up momentarily, and prevent the exhaust valve from returning to its seat. When he dismounted to seek for the trouble the refractory bell crank dropped down, so that his valve appeared to be working correctly. This was indeed rough luck.

J. Marshall!

(3½ h.p. Triumph,) the winner of the Tourist Trophy, just crossing the finishing line. He made the fastest time of the day, averaging 40½ miles per hour.

CURRENT CHAT.

SPECIAL FEATURES.

1908 T.T. RESULTS AT A GLANCE.

Special Illustrations from Manxland.

THE HILL-CLIMBING QUESTION REVIEWED.

TIME TO LIGHT LAMPS.—Sept. 30th, 6.42 p.m. ; Oct. 3rd, 6.35 p.m. ; Oct 7th, 6.26 p.m.

A Distinct Novelty.

The Continental Tyre Co. are introducing a green coloured air tube for pneumatic tyres. It will be made of the finest quality indiarubber obtainable.

La Coupe d'Evreux.

In the above speed trials, which were held at the beginning of last week, a Quentin machine covered the flying kilometre in 42½s. = 52¼ miles per hour. This was in the class for machines fitted with engines not exceeding one-

R. M. Brice (3½ h.p. Brown) who completed the T.T. course in 4 hrs. 49 mins. 58½ secs. He used accumulator ignition on his machine.

third of a litre. The second and third places were secured by Moto-Rêve lightweights, the speed being 33½ miles per hour. In the quarter litre class the Albatross was successful. The Herdtlé-Bruneau beat the Moto-Rêve by 1½s. in the class for machines weighing less than 62 lbs. In the class for racing machines (Grapperon (Alcyon) tied with Olieslagers (Albatross), time 33½s. = 67 miles per hour. In the mile race, uphill with a standing start, the Quentin machine again beat the Moto-Rêve, and also won the quarter-litre class. In the lightweight contest (machines under 62 lbs.) Moto-Rêve machines were first and third, and the

Herdtlé-Bruneau second. The fastest time was 1m. 59s. = 30.4 miles per hour. Olieslagers just beat Grapperon in the racing class by 3½s. in the time of 1m. 9½s. = 52 miles per hour.

Mr. Fawcett Still Climbing.

Readers of Mr. E. Douglas Fawcett's adventurous tours which have been published in *The Motor Cycle* will learn with interest that he has just successfully climbed the Grande Arvey, Haute Savoie, which is 4,000 feet above the level of the sea—this time on a car, one of the latest single-cylinder De Dion voiturettes. The climb comprises at least six kilometres with gradients varying from 1 in 4 to 1 in 3½.

Semmering Hill-climb.

There was only one class for motor bicycles at the annual hill-climb on the Semmering Pass, near Vienna, and that was confined to lightweight machines. The results were: 1, Wolf (Puch), 11m. 27s.; 2, Kradetzy (Puch), 11m. 47s.; 3, Werlin (Puch), 12m. 31s. It is interesting to note that two of the heavy racing cars were driven by some time motor cyclists, and both were successful in their respective classes. Willie Poege drove a Mercedes in the class for cars run under the Prince Henry Cup formula, and beat Nikodem, another old motor cyclist, on an Austrian Daimler. Nikodem, driving a Laurin and Klement, was first in the class for cars with single-cylinder engines not exceeding 130 mm. bore.

A.C.U. Council Meeting at Leamington.

It is intended to make the meeting at Leamington on October 10th an attractive one, and by this means to induce a large number of motor cyclists to take part in the gathering. The council meeting will be held in the afternoon, and in the evening a dinner will take place followed by a smoking concert, of which further particulars will be announced later. Leamington is an ideal place for the holding of such a meeting, and motor cyclists will find much to interest them in the neighbourhood. It also has the advantage of being easily reached from practically anywhere. The roads and scenery in the district are excellent. For those who ride back on the Sunday some delightful trips can be found to Stratford-on-Avon, Warwick, Coventry, etc. The secretaries of provincial clubs are urged to support this fixture and to make Leamington the objective for their members on October 10th.

An Eminent Author witnesses the T.T. Race.

Mr. Hall Caine was among the interested spectators of the T.T. Race.

Saturday's Motor Cycle Race at Brooklands.

Entries for the 5½ miles handicap race at Brooklands closed last Saturday, several of the Tourist Trophy competitors being among the entrants. For this event the limit size of twin-cylinder engines was increased from 80 by 98 mm. to 85 by 95 mm. each cylinder.

Lessons from the T.T. Race.

In our description of the T.T. Race last week we gave the average speed of the winner as 38.7 miles per hour, but our figures were calculated without deducting the ten minutes allowed after the fifth round for replenishing the tanks. J. Marshall's actual time was 3h. 54m. 50½s., which is equal to an average speed of 40½ miles per hour. C. R. Collier was second fastest, his speed being 40 miles per hour, and H. Reed (the winner of the twin class) third fastest, average speed 38½ miles per hour. Last year's best average speed was 38½ miles per hour by C. R. Collier, the petrol allowance in this case being ninety miles to the gallon; so that, although the mileage per gallon was increased in this year's race, the competitors were able to make better average speeds. This is a striking proof of the utility of the race, and the improvements that have been made during the last twelve months.

M. Geiger, who rode one of the two N.S.U. machines in the T.T. Race fitted with a two-speed gear.

Dangerous Tram Lines.

Following a letter addressed to the manager of the Croydon Tramways by the Motor Union as to a 3in. gap in the metals opposite the Thornton Heath depot, and many other places where the aperture is dangerous to motor vehicles with tyres smaller than 65 mm., the Union is informed that the dangerous place at Thornton Heath has been repaired.

To Protect Deaf Cyclists.

The Council of the Cyclists' Touring Club desires to call the attention of road users—and motorists in particular—to a simple and efficient device for safeguarding deaf cyclists. This consists of two red and white semi-circular discs attached to the back forks of the bicycle. They feel that, if once this signal is understood and recognised by road users, deaf cyclists will have the assurance that their affliction will not endanger their lives, as motorists and others when overtaking a rider provided with these discs will be aware that the motor horn or other sound signals are inaudible to him, and will act accordingly. This simple and practical device was invented by Mr. W. E. E. Baxter, who is himself a sufferer.

A. F. Wilding on the way to New Zealand.

Mr. A. F. Wilding, the champion lawn tennis player, and an enthusiastic rider of a Bat motor bicycle on which he successfully competed in the A.C.U. End-to-end Ride, sailed for his native land (New Zealand) last week. A portion of his baggage comprises a set of sample Bat motor cycles, and he will represent the makers in future for both Australia and New Zealand. Interested colonial readers should address letters to A. F. Wilding, Hereford Street, Christchurch, New Zealand.

A Tourist Trophy Veteran.

Apropos of the Tourist Trophy Race, H. A. Collier has probably competed in more eliminating trials and trophy races than any other British rider, he having twice raced abroad in the International contest, while he has been a competitor in eliminating trials three times. Collier will attempt next year all the long-distance records, and will endeavour to crowd 1,000 miles inside the twenty-four hours, probably at the Brooklands Track. He is the present holder of the world's 100 miles record.

The Hour Record.

C. R. Collier, who finished second in the single-cylinder class in the I.O.M. race, has designs on the hour record of 63 miles, held by Giuppone, made at the Parc des Princes track, Paris. Collier is having a special machine built, and in the very near future will endeavour to accomplish 65 miles in 60 minutes. The speedy rider considers Canning Town the best track for short-distance speed work, but for long distances, such as the hour, Collier prefers Brooklands, and will make the attempt on the Weybridge enclosure.

Handle-bar Control in the T.T. Race.

It was possible to count on the fingers of one hand the T.T. machines that had the old-fashioned tank control levers. No one who has ridden a machine with a handle-bar-controlled carburettor would think of returning to tank levers, and there being no strain on the levers the wires do not give trouble through stretching, even after continued use. We predict that a motor cycle with control levers on the tank will be difficult to find at this year's Stanley Show.

Notices of Expiring Driving Licenses.

Summoned for riding a motor bicycle without a driving license, F. Durling wrote to the court stating that his license expired in August, and it was an oversight that it was not renewed. He tendered his apology for what he termed a trivial offence, and thought that notices should be sent to license holders before the licenses expired. The Chairman concurred, and he was let off with a fine of 2s. 6d.

Italian Customs Regulations Involved.

Messrs. Davies, Turner, and Co., Ltd., international carriers, 52, Lime Street, E.C., sound a note of warning to tourists in Italy, and our readers would do well to make very careful arrangements prior to importing motor vehicles into that country, as the unfortunate owners are subject to all manner of pains and penalties if clearance through the Customs be not effected by experienced clearing agents fully conversant with the rules and regulations of the Italian Customs. Should it happen that a technical misdeclaration take place, the authorities do not hesitate to invoke the operation of the very drastic laws which necessitate the payment of a colossal fine. The company named will at all times respond to any application made by our readers for that advice which it is so necessary to obtain from expert sources.

Hill-climbing Formula.

As our readers know, questions have arisen regarding the performances of certain types of engines at hill-climbs during 1908, and the Auto Cycle Union has invited Prof. H. L. Callendar, Prof. Archibald Sharp, and Mr. J. W. G. Brooker to act as a sub-committee to consider the matter.

Hedge Cutting.

As a result of representations by the Motor Union, steps are being taken to trim the hedges on portions of the Reigate-Dorking Road.

Exciting Finishes.

Some extremely close finishes were witnessed in the motor cycle and car races held in the Isle of Man last week. For instance, in the motor cycle race which occupied nearly four hours, Marshall only beat Collier by 2m. 10s., and in the car event Watson led Lee-Guinness by 2m. 16s.

A Penny Motor Fine.

Hugh Tyndale was fined one penny at the Mortlake Police Court on the 17th inst. for driving an unregistered tricar. Defendant said he was an apprentice employed by a motor company, and did not know that the machine he was using was not registered. Registration was a matter with which he personally had nothing to do. The Chairman of the Bench said that before the defendant could be held liable he must have had the opportunity of registering the tricar. If an offence had been committed it was a very technical one.

FUTURE EVENTS.

- Oct. 2—Gaillon Hill-climb, France.
- " 3—Bradford M.C.C. Open Hill-climb for Motor Cycles.
- " 3—Brooklands A.R.C. Meeting (Motor Cycle Handicap).
- " 3—Penalty Run for Members of the A.C.U. and Clubs in the South of England Districts affiliated to it.
- " 10—Auto Cycle Union Council Meeting at Leamington Spa.
- " 17—Auto Cycle Union Quarterly Trial of Motor Cycles, Uxbridge to Banbury and back.
- " 21—Motor Union General Committee Meeting.
- Nov. 20-28—Thirty-second Annual Stanley Show, at the Agricultural Hall, Islington.
- " 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.
- Dec. 16—Motor Union General Committee Meeting.

The Dublin and District M.C.C. owes its initiation to Mr. M. J. Chambers, the present hon. sec., who is depicted above with his 2½ h.p. F.N. Motor Bicycle. The club was formed at the commencement of the present year, and has carried out an extensive programme of hill-climbs, reliability trials, and speed competitions, the latter being held on the velvet strand at Portmarnock.

THE BROOKLANDS MOTOR CYCLE HANDICAP.

FOR the Motor Cycle Handicap Plate of 25 sovs., to be run on Saturday next at Brooklands, twenty-eight entries have been received, as under noted. The race is open to motor bicycles of which the engines, if twin-cylinder, do not exceed 85 by 95 mm. for each cylinder. Starters barred. Distance five and a half miles. The entrant of the winner to receive 15 sovs., the entrant of the second 7 sovs., and the entrant of the third 3 sovs.:

Entrant and machine.

Mr. J. C. Davis (5 h.p. Rex).
Mr. G. Gibson (3½ h.p. Triumph).

Mr. T. H. Tessier (Bat).
Mr. R. O. Clark (5 h.p. F.N.).
Mr. Phil Baker (2¾ h.p. Minerva).
Mr. F. H. Arnott (Chater-Lea).

A BROOKLANDS RACER.

THE latest production of the N.S.U. Motor Co. is an 8 h.p. racing motor bicycle fitted with a twin-cylinder engine, having a bore and stroke of 80 × 100 mm. The machine, to put it briefly, is

quite the most perfect high powered racing motor bicycle we have yet seen. Carried on the top bar is a large torpedo-shaped oil tank fitted with a pump operated by means of a Bowden wire attached to a lever fitted to the handle-bar, so that to give a charge of oil the racing man has no need to let go of the handle-bar and fumble for a tap. The engine is fitted with mechanically-operated inlet valves arranged on the overhead principle so effectively carried out by the N.S.U. Co. For the sake of lightness an aluminium crank-case has been provided, which is contrary to N.S.U. practice. The Bosch magneto is gear driven, the gear wheels being enclosed in an aluminium gear case. The carburetter is of large dimensions, and the throttle works on a ratchet so that it cannot shake loose. The advance spark lever is situated on the handle-bar, and is capable of remaining in any position in which it is set. It is connected to the contact breaker

by means of a Bowden wire. The machine is intended for racing on the Brooklands track. It is interesting to note that the 6 h.p. touring N.S.U. can now be purchased with mechanically-operated valves arranged on the same

A racing N.S.U. of 8 h.p., which the makers are anxious to run on the Brooklands Track.

principle as that referred to above. We have previously pointed out the importance of having mechanically-operated valves on twin-cylinder engines.

A RELIABLE LIGHTWEIGHT.

WE were, fortunately, able to refer briefly in last week's issue to the 2 h.p. Moto-Rêve which we used during the Isle of Man races. This little machine, which was placed at our disposal by the Moto-Rêve Co., did most excellent work. Almost immediately after its arrival on the day preceding the race it had to work extremely hard. In the town of Douglas it buzzed merrily about, easily carrying the writer up the steep hills which abound, and later it took him safely over the muddy roads to Ballacraigne, where the competitors were practising. In grease it proved itself to be exceptionally steady,

and, though it carried a rider of about eleven stones weight, it never needed pedal assistance on even really steep gradients. During the day of the race it was kept busily employed first in carrying the writer to St. John's, and for the rest of the day in bearing press telegrams from the start to the G.P.O. at Douglas. Only on one occasion was it possessed with a fit of misfiring, which, curiously enough, could not be located, but this state of affairs eventually righted itself automatically. The machine impressed us most favourably, and of its efficiency, despite its light weight, we cannot speak too highly.

CLUB NEWS.

Great Yarmouth and District M.C.C.

At this club's gymkhana, the last event, "bobbing for apples," was won by Mr. Smith. Dr. Blake was second, and Mr. Barnes third.

Harrogate M.C.

On the 19th inst. a hill-climb took place at Briscoe Rigg, near Stainburn. The club is mainly composed of car owners, but the cyclist section proved to be the interesting item of the afternoon's sport, F. Mackay, on a 3½ h.p. Triumph

Some of the motor cycle section of the Harrogate M.C.

1907), doing fastest time, and winning on formula, figure of merit 63.5; T. Atkinson, on a 3 h.p. Triumph (1906), second fastest time and second on formula, figure of merit 73.9. B. Tindall was third and E. R. Davies fourth.

Worcestershire M.C.C.

A non-stop reliability trial has been fixed for October 11th, from headquarters to Droitwich, Ombersley, Hartlebury, Kidderminster Road as far as Chaddesley, Corbett, Belbroughton, Catshill, and Bromsgrove. Distance twenty-seven miles, to be covered four times. The full number of marks will be 1,000, and deductions will be made as follows: Tyre stop, one mark per minute; mechanical stop, ten marks per minute.

The date of the annual dinner has been fixed for Saturday, October 17th, at the Golden Cross Hotel, Bromsgrove.

Nottingham M.C.C.

A successful hill-climb was held at Bunny Hill on the 19th inst., the road and weather conditions being favourable. The results on the formula will be announced in due course. The times made by the competitors (who were allowed two runs) were:

Rider and machine.	1st run.		2nd run.	
	M.	S.	M.	S.
G. H. Pearson (2¼ h.p. Acme-Bentinck)	3	34	2	49
W. T. Smith (4 h.p. Roc)	2	7	2	5
G. Brough (3½ h.p. Brough)	2	5	Nil	
W. J. Jones (5 h.p. Antoine)	2	1	2	9½
Dr. E. Bigg (3 h.p. Triumph)	2	40	Failed	
P. G. Toplis (3½ h.p. Triumph)	2	7	2	12½
Hy. Jackson (7 h.p. Champion)	1	58	1	50½
C. R. Smith (3½ h.p. C.C.R.)	2	14	2	12½
W. Reilly (3½ h.p. Triumph)	2	34	Nil	
G. C. Holmes (5 h.p. Roc)	2	15	2	14½
A. Walton (5 h.p. Vindec Special)	1	50	1	54½
L. A. Nolan (3½ h.p. Triumph)	2	10	2	6
C. H. Johnson (3¾ h.p. N.S.U.)	2	12	2	10½

During the event Mr. Bowden declared the winners of the reliability trial held on September 5th, when the course was to Kettering, via Loughborough, Leicester, Market Harborough, returning via Oakham and Melton. The figures of Mr. Chas. Hardy, the judge, are:

G. H. Pearson (2¼ h.p. Acme-Bentinck), 1 (president's cup and gold medal); Dr. Bigg (8 h.p. Clément car), 2 (gold medal); B. W. Maltby (4½ h.p. Minerva), 3 (silver medal); J. King (10-12 h.p. Swift car), 4; Claude H. Johnson (3½ h.p. Triumph), 5; L. A. Nolan (3½ h.p. Triumph), 6.

Lincolnshire M.C.C.

The Grantham Centre of the Lincolnshire Club held a meet at Frieston Shore, near Boston, on September 20th, a number of members riding over and staying the night at the Marine Hotel. A most enjoyable day was spent on the sea shore and samphire beds, the party breaking up after tea on Sunday afternoon. A suggestion was made for a meet of the entire club next summer at the same place, as there are a great many objects of interest in the neighbourhood.

Middlesbrough and District M.C.C.

The winners in the hill-climb at Yearby Bank were: 1, G. R. Sanderson, .0088; 2, R. W. Day, .0086; 3, W. Danby, .0082.

On the 23rd inst., the last competition of the year was held in the form of a petrol consumption trial over a distance of 22½ miles. The following is the order in which the competitors finished:

	Fig. of merit.	M.P.G.
1. Mr. Bellerby (3½ h.p. Minerva)	.507	132
2. Mr. Danby (2 h.p. Moto-Rève)	.466	184
3. Mr. George (3½ h.p. Rex)	.465	121
4. Mr. Reese (3½ h.p. Rex)	.404	113
5. Mr. Sanderson (3½ h.p. Triumph)	.374	108

Weight

The formula used was:
Cubic centimetres of petrol

Hull and East Riding A.C.C.

The result of the Scarborough reliability trial as given on page 752 last week is incorrect. The deciding event was a pace-judgment test. Pace to be judged, seventeen and a half miles per hour. The result was: 1, Mr. R. A. Resler (4½ h.p. Rover Tricar), .519 too slow; 2, Mr. T. Straker (3 h.p. Triumph), 1.547 too fast; 3, Mr. R. Pearson (3½ h.p. Minerva), 2.065 too fast; 4, Mr. G. W. Mumby (3½ h.p. Triumph), 1.056 too fast.

The picnic held on Sunday last proved a great success. After a good run, a walk to Spurn and back was greatly enjoyed by a few of the party. On returning home through Patrington, Dr. Coates's house was visited, and the party entertained during the evening.

On Saturday next, October 3rd, a hill-climb in conjunction with the Lincolnshire M.C.C. will be held at Elsham Hill, near Brigg. The Hull party will leave the Corporation Pier at 1.40. Entries can be made on the spot, and machines weighed at Elsham Station at the foot of the hill.

W. H. Bashall and the 6 h.p. Bat-Jap on which he gained second place in the Tourist Trophy Race (Twin-cylinder Class). He rode most consistently, as at half distance he held the same position. Mr. Bashall is an amateur rider and has entered his 3½ h.p. Triumph for the Brooklands Handicap on Saturday.

Club News.—

Walthamstow M.C.

The above club held a reliability and penalty run to Chelmsford on Saturday, September 19th. The winners were as follows: W. H. Applebee (3¼ h.p. Rex tricar), W. S. Low (3½ h.p. Rex), C. W. Lee (3½ h.p. Rex), Dr. Samuel (5 h.p. Vindec Special), R. J. Liles (5½ h.p. tricar), and J. W. Percival (6 h.p. Fafnir tricar).

Southampton and District M.C.

A very successful motor cycle hill-climb took place at Stoney Cross Hill in the New Forest on Wednesday last, the results being as follows:

Rider and machine.	Time.	Figure of merit.
Mr. Stewart (4½ h.p. F.N.) ...	28½s.	35.8
Mr. Prince (4½ h.p. Minerva) ...	24½s.	24.8
Mr. May (5 h.p. F.N.) ...	37s.	22.3
*Mr. Rowe (7-9 h.p. Peugeot) ...	17½s.	20.4
Mr. Hammond (3¾ h.p. Rex) ...	34¾s.	20.3
Mr. Prince (3 h.p. Raleigh) ...	42¾s.	20.1
†Mr. Jones (3½ h.p. Rex) ...	—	—

* Fastest time. † Failed.

Dublin and District M.C.C.

A novel form of competition was held on Saturday last by the Dublin Club, when a non-stop penalty trial was run over a circular course of forty-five miles, starting from Inchicore and finishing at Terenure, the route covered being by Naas, Ballymore-Eustace and Blessington. The idea was that the competitors should maintain a pace of between eighteen and twenty miles per hour, any variation in either direction being penalised, while penalties were also enforced for involuntary stops on the journey. The competitors were not allowed to carry either watches or speed indicators. The weather was fine, but owing to the overnight rain the roads were very heavy, particularly between Naas and Ballymore-Eustace. A minimum time of 2h. 15m. and a maximum time of 2h. 30m. was fixed. Only one of the competitors failed

THE T.T. FUND.

Additions to the Auto Cycle Tourist Trophy Fund are as follows:

Chas. Jarrott ...	£2 2 0
S. F. Edge ...	1 1 0
The Bosch Magneto Co. ...	1 1 0

The following contributions to the Shilling Fund were received during the week ending Saturday, September 26th: Birmingham Motor Cycle Club (21), R. E. S. Spender (5), A. J. Dunnell (2), V. A. Holroyd, E. W. Walford, C. S. Burney, E. W. Harris, A. Riley, A. P. Smith, W. Grew, A. J. Dunnell, T. F. Turner, T. W. B. Durant, F. Dover, H. Dakin, R. Kay, J. W. Arden, S. Sawyer, D. Coutts, J. Farrar, J. Haslam, and J. Watkinson (1 each).

A BALLOON CHASE ON MOTOR CYCLES.

A BALLOON pursuit organised by the Silesian and Posen branch of the German Motor Cycle Association in co-operation with the Silesian Balloon Club resulted in a victory for the road vehicles, although Dr. Van der Borne, who was in charge of the balloon, utilised the air currents with fine aeronautic skill, and led his pursuers a rare dance, eventually landing in an almost inaccessible clearing in the middle of a wood near Luckau. Dr. Borne was supposed to be carrying despatches from "beleaguered" Breslau. Twelve drivers of small cars and seven riders of motor cycles constituted the enemy, and it says much for the pursuers that, notwithstanding the necessity they were under of crossing the River Oder twice and tackling all sorts of roads and by-roads, nine reached the clearing, the first, indeed, within a quarter of an hour after the balloon, thus fulfilling the condition under which the balloon was to be captured. It is satisfactory to know that three cycles were amongst the arrivals, and that Herr Eitner, who drove a 3 h.p. Phänomen,

to get inside these limits, and only one made an absolute non-stop run. The result of the competition was as under:

Name of rider and machine.	Time.
H. M. S.	
F. J. Walker (5 h.p. Rex), non-stop ...	2 17 1
J. Doleman (3½ h.p. Rex), two stops ...	2 19 2
R. H. Taaffe (3½ h.p. Triumph), one stop...	2 32 3
T. Geoghegan (3½ h.p. Triumph), one stop	2 53 4
M. J. Chambers (2¾ h.p. F.N.), three stops	2 50 5

Mr. J. Browne acted as starter and timekeeper.

Newcastle M.C.

This club held a very successful hill-climbing competition on the 20th inst. at Eglington Bank, near Alnwick. The

formula was $\frac{W}{C \times T}$. Results:

SINGLE-CYLINDER (80 × 80 mm. and over).

Name of rider and machine.	Figure of merit.
Isaac Baty (3½ h.p. Dene)000
W. H. Peel (3½ h.p. Frank)278
A. C. S. Broadway (3½ h.p. Rex) ...	18.793

TWIN-CYLINDERS.

A. G. Robson (4½ h.p. Minerva)000
H. Mason (5 h.p. Berkley) ...	18.289
A. C. S. Broadway (5 h.p. Rex) ...	28.727

PASSENGER CLASS.

A. G. Robson (4½ h.p. Minerva and sidecar)...	.000
W. Taplin (6 h.p. Rex Litette) ...	5.483
R. B. Smith (6 h.p. N.S.U. Tricar) ...	38.720
W. H. Peel (3½ h.p. Frank tricar), failed.	

The arrangements were successfully carried out by Mr. B. Wilford, the secretary, and Mr. A. E. Brunning, of Lincoln, was judge and timekeeper.

M.C.C. CONSUMPTION TRIAL.

In the report of the M.C.C. consumption trial, published in *The Motor Cycle* of the 16th inst., the mileage per gallon results were given incorrectly. They should read as follows: 1, G. L. Fletcher (2 h.p. Moto-Rève), 160.9 miles per gallon; 2, W. Smith (2 h.p. Moto-Rève), 170.8; 3, H. G. R. Slingo (6 h.p. Griffon), 98.8. The actual distances covered by the competitors in the motor cycle class were as follows: G. L. Fletcher, 24½ miles; W. Smith, 23¾ miles; H. G. R. Slingo, 19¼ miles; S. G. Frost, 19 miles; R. C. Davis, 19 miles; V. Olsson, 18¾ miles; Stanley Webb, 17 miles; A. W. Bentley, 16¾ miles; A. G. Fenn, 16¾ miles; F. White, 16½ miles; W. Pratt, 15¾ miles; H. C. Sayer, 15¾ miles; B. C. Cumberland, 15½ miles; F. Mussell, 14¾ miles; and C. Gibbons, 14 miles.

arrived second, and was but seven minutes behind the driver of a powerful Adler car, who effected the "capture" for the Association. But for the seven minutes the honour would have gone to the cycling contingent, as Herr Eitner was well within the hour of grace granted to the pursuers. The balloon landed at 11.42 a.m., and Herr Eitner appeared on the scene at 12.3 p.m. Herr Hielscher, who drove a 3½ h.p. Magnet, also arrived before the hour had elapsed, but the third cyclist failed by eighteen minutes. The trophy secured for the Association is a very valuable and handsome work of art.

Two or three months back we put a four-volt 20 amp. Ajax accumulator in commission. It has behaved in so satisfactory a manner that we had almost forgotten about it until the makers—the Ajax Electrical Engineering Co., Oaklands Park Avenue, Ilford—sent us a reminder a few days ago. The Ajax accumulator we have had on test has given absolutely no trouble, and holds the charge very well.

TIPS FOR TRIUMPH RIDERS.

AT a time when most riders find their machines in need of a slight overhauling, as the result of a summer's riding, these few remarks may not come amiss. Although referring primarily to triumph motor cycles, they may be adapted to most other makes.

Exhaust and inlet valves often present difficulties to the inexperienced, such difficulties generally resulting in much plain speaking and burnt and bruised knuckles. One method of removing the elusive cotter from underneath the spring is to use one of the valve spring lifting tools as sold by most accessory shops. Another method, both simpler and better, is as follows: Remove the valve cover from the cylinder head, and turn the engine pulley until the valve in question is fully open. Then place a screwdriver or similar implement across the radiating fins at the back of, and just under, the spring cap. A turn of the engine pulley will then allow the spring cup to rest on the screwdriver, and a light tap on the valve head in the cylinder will bring the valve down and place the cotter so that it may be removed with ease. If the valve is to be ground in, the spring need not be removed from its position. This method is extremely useful in the event of the cotter and slot in valve stem being slightly burred, as they generally are, it being quite possible to file them with facility. It is a useful precaution to file the burrs from both cotter and valve stem before a tour or long competition run, when speedy removal of valves, if necessary, is desirable.

For extracting a hot valve a little hand tool is provided to screw into the head of the valve. To facilitate grinding, if the round milled head of this tool be cut away to a square shape, with sides of about $\frac{3}{8}$ in., it may be used in conjunction with an ordinary hand brace with greatly improved results, both in speed and efficiency, whilst its mission as a valve extractor is unimpaired.

After some time it occasionally happens the machine does not entirely cease firing when the exhaust valve lifter is raised, the firing being accompanied by popping in the silencer. This is usually due to stretch in the

Bowden wire, and it should be remedied. The cure is simple. First remove the wire from the stop on engine, which is done by pulling the black covering of cable towards the silencer pipe, at the same time lifting upwards. Then remove the wire end from the nipple on the little lever on engine, by pushing the wire inwards and downwards. A coil, or perhaps two, of copper wire, about $\frac{1}{16}$ in. diameter, should then be wound round the end of the Bowden wire, and the wire replaced in the nipple and stop. Sufficient copper wire should be added until all slackness has been taken up. When removing the throttle and air pistons from the carburetter, it is advisable to lift the black covering of Bowden cable quite clear of the plated cover. Should there be any tendency for the pistons to stick whilst riding, a few vigorous movements of the levers on the handle-bar will effect a speedy remedy. This last should be done with the exhaust valve lifter raised.

It is a fairly general custom to carry a spare contact breaker complete. Whilst this is a very good idea, care should be taken to see that the timing of the machine is not affected by the change. Two contact breakers I have, make a difference of a quarter of an inch (piston movement) in the timing, which is quite enough to cause bad running on hills, whether the error be on the advance or retard side of normal.

For the experimentally minded, I would suggest that a sparking plug fitted in the hole for the compression tap affords a splendid chance of comparing the efficiencies of the various positions for plugs. (A short plug of the type used on the Moto-Rêve is necessary, and the hole must be enlarged.) Also that very light springs fitted under the valve tappets to hold them up to the valve stems help to reduce noise.

For those whose lot it is to ride on rough roads, an indiarubber buffer threaded on the spring spindle of the front forks is a boon, saving springs and machine. The buffer may be made out of an old pedal rubber, cut a little shorter than the large spring when in use (say $\frac{3}{4}$ in. shorter). A washer, fitting over the spindle and a little larger than the hole in the moving spring plate, is necessary.

W. R.

The Tourist Trophy Race. Noel E. Drury and C. B. Franklin, two private owners from the Green Isle, taking matters easily on the road to Ballsbridge.

Questions & Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E. C., and whether intended for publication or not **must be accompanied with a stamped addressed envelope for reply.**

Adjustments for Slow Running

? My 7 h.p. twin motor bicycle runs beautifully at high speed, but when reduced to about ten miles an hour the engine stops firing, and there seems no way of regulating it to run slowly. I have a tricar and another motor cycle, but find no difficulty in regulating the speed. I shall be glad if you can suggest a cause.—ENQUIRER.

You have evidently got a carburetter which does not allow the engine to run very slowly, probably owing to it allowing too much air to pass at slow speeds. You might try fitting a smaller choke tube and increasing the size of the extra air inlet, so that you can give less air at slow speeds and more air at high speeds. The gear of the machine may also have something to do with the trouble.

A Loss of Power.

? My 2 h.p. engine will not give any power. It runs fast on stand, but when on the road I have to pedal in order to keep it going. Timing is correct. Jebron points, also inlet and exhaust valve springs correct. It bears weight on pedal for a few seconds. B. and B. latest carburetter, dry battery ignition, new battery. Could wiring be at fault in connection with intensity of spark? Please say what I should do to the new B. and B. carburetter to make it right or alter it for fear it is wrong. I put a light washer on float and it floods. The weights on top do not seem to come down well. The needle appears to balance them. Is this correct? The engine appears to get a bit hot when run on stand for a short time. Exhaust valve has good lift.—A.R.

We do not think that the intensity of the spark is at fault; the trouble is more likely to be due to the adjustment of the carburetter, to weak compression, or too strong a spring on inlet valve. Are you sure that the carburetter is perfectly clean? By weighting the float you raise the level of the petrol. Make quite certain that the petrol is coming through the jet properly and stop the flooding at once by removing the washer. Are you sure that the exhaust valve spring is strong enough? When the machine is at rest the float should allow the weights to lower the needle and shut off the supply of petrol.

Ignition Items and M.O.V. and A.O.V.

? (1.) My $4\frac{1}{2}$ h.p. J.A.P. misfires occasionally at high speed, yet runs well and climbs hills well up to 16-18 miles per hour. It has accumulator ignition, carburetter B. and B. (2.) What is the most suitable magneto for this engine, and what would be the probable cost of converting from accumulator to magneto? (3.) This engine has an a.o. inlet valve. Will so large an engine run slowly with this kind of valve?—J.S.

(1.) If the accumulator is fully charged, and the carburetter all right, the missing is undoubtedly due to the adjustment of the contact points. Run the engine on the stand and give the contact screw half a turn nearer to the point on the trembler blade. (2.) A high tension magneto would be most suitable, and the conversion would cost from £6 to £8. (3.) An engine with an automatic inlet valve will not run as slowly as one with a mechanical inlet valve, but if properly driven yours can be regulated to about seven miles per hour without switching off.

Insufficient Air Supply, and the Proof.

? I drive a $2\frac{3}{4}$ h.p. De Dion-Bouton motor cycle. It misfires badly at speed unless I hold exhaust lifter slightly up, thus preventing valve from quite closing. Can you tell me the reason of this, and a remedy for it? I have fitted new spring on valve and ground valve in, but it does not cure it. The clearance between valve and tappet is about 1-32in. With the slight pressure on valve lifter it runs beautifully, but on hills I have to let it down to get any power.—E.C.J.

The trouble is caused by insufficient air supply at the carburetter, in consequence slight pressure on the exhaust lifter causes a certain amount of air to enter through the exhaust port on suction stroke, which dilutes the mixture sufficiently to render it explosive at high speeds. The reason you can let the valve lifter alone on hills is because at the slower speed of the engine a richer mixture is required. If the carburetter is altered to allow a greater amount of air to enter at high speeds, the misfiring should cease.

The Tourist Trophy Race. Two competitors at full speed at Ballig Bridge—not the least picturesque spot on the fifteen miles circuit.

Nail Catchers.

?

Some riders of motor cycles adopt a device for "thorn and nail catching." They fix a piece of wire round the chain stays of their machines, believing this will draw out nails and thorns from the back tyre before they have penetrated enough to puncture. Do you approve of this? Is it dangerous? Would the back stays running up to the seat-pillar be as good a place as the chain stays to fix this puncture-preventing device?—A.V.H., Wilts.

We certainly approve of nail extractors, and there is no better way of catching nails than fixing a piece of wire to the chain stays, or, better still, to the mudguard stays if they are strong enough. Of course, it is quite within the range of possibility to get a nail or something in the tyre with the catcher fitted, but from our experience they do prevent a good many punctures. There is no danger in it at all. In fitting the wire do not fit it too close to the tyre, but leave about $\frac{1}{4}$ in. clearance, and see that there is that amount of clearance when wheel is revolved.

Tyres and Sidecar Attachments.

?

(1.) Could you tell me the largest tyre I could fit to my twin Vindec (if I had my wheel re-built) that would pass between the back forks? Also probable cost of building up wheel and cost of tyre (probably voiturette)? Do you recommend Kempshalls for same? (2.) I have Hermetic tubes, and have failed always to get ends inserted. How is this done? (3.) I have a Montgomery sidecar, and the front attachment on cycle only allows about 1-16 in. clearance between it and the spring fork curved support of Vindec. Could I get over this in any way?—J.G.S., N.B.

(1.) You can tell best yourself the largest size of tyre you can use by measuring the space between back forks and allowing half an inch on each side of the tyre for clearance. It would be inadvisable to allow less than this amount of clearance without the risk of the tyre rubbing if the wheel got the least bit out of truth. Having had no experience of the tyres you enquire about we cannot advise you, but you would find practically any good make of voiturette tyre quite suitable for the back wheel of your motor bicycle. With a large tyre, however, sideslip is more pronounced. (2.) We have found no difficulty in inserting one end of the Hermetic tube inside the other. Wet the ends, and fold one end right over, and while holding it in the fingers insert it in the other end of the tube. Both washers should be firmly locked against the corresponding rings or recesses in the opposite end of the tube. (3.) The front attachment for the sidecar apparently is not long enough. We presume the clearance mentioned (1-16 in.) could be increased by lengthening the attachment on the cycle or on the sidecar, and it would be an easy matter to have this lengthened by any local engineer. Make sure that the alteration would not throw the sidecar out of line with the bicycle.

Respecting a Light Tricar.

?

(1.) Please let me know the best way to start my $3\frac{1}{2}$ h.p. tricar engine with starting handle, and where the piston ought to be when the spark takes place? The machine has accumulators and plain coil and Bozier two-speed gear. The engine is geared up from starting handle $2\frac{1}{2}$ to 1. Is it better to lift valve till a good speed is attained or to pull up once over compression? (2.) The Bozier gear is fitted with cone clutch for high gear, and a band brake is applied for low gear. Can I start from standstill with passenger by applying the brake gradually on the low gear drum? (3.) Can you tell me the two best gear ratios for this machine for passengers twenty-two stones, machine 2 cwt.? (4.) Best lubricant for chains?—H.V.

(1.) There is always a certain amount of difficulty experienced in starting a

H. V. Colver, who rode one of the three most powerful machines in the T.T. Race, viz., a 7 h.p. Matchless-Jap. He ran out of petrol near the finish.

small single-cylinder engine by a handle owing to the size of the flywheels. The air should be closed, throttle opened, the spark not quite retarded, and the handle pulled over sharply. When sparking lever is advanced nearly halfway the spark should take place when the piston is at the top of the compression stroke. With engine geared up from starting handle in the proportion of 4 or 5 to 1 it is best to lift valve and turn the engine until a good spark is obtained and then release. It would also apply when geared $2\frac{1}{2}$ to 1, but handle would require to be revolved a little faster. (2.) When starting, accelerate the engine slightly, and simultaneously apply the low gear brake gently. (3.) There is no choice. If a $5\frac{1}{2}$ to 1 top gear is used, the Bozier

will give 11 to 1 when reduced. (4.) Chain lubricant can be obtained from most accessory dealers. It usually consists of graphite mixed with grease.

A Motor Bicycle for West Africa.

?

I should be glad of your advice as to a suitable motor cycle to take out to West Africa. The roads are narrow and bad—very sandy in places, and loose and stony in others. A magneto (or dry battery) is essential. I weigh fifteen stones. A top speed of twenty-two or twenty-three miles an hour is ample. I have no experience with motor cycles, but have owned motor cars for some years, and have bicycled for thirty years. My height is 5ft. 11in., and I ride a 26in. frame push bicycle. How many miles to the gallon of petrol should the machine you recommend average? And what spares are necessary?—S.W.T., Salop.

If you will send a numbered list of the machines you contemplate purchasing, and keep a key for reference, we shall be pleased to place them in order of merit. A $3\frac{1}{2}$ h.p. single-cylinder machine should run about ninety miles to a gallon of petrol, and the spares necessary depend on the machine you select, but with an up-to-date one of good manufacture spare valves, plug, belt, fasteners, and possibly, a complete contact breaker for the magneto are all that will be required.

READERS' REPLIES.

Inlet Valve Joints.

Some time ago a rider complained in *The Motor Cycle* that he could not get the automatic inlet valve joints tight on his N.S.U. My twin N.S.U., which has been 9,000 miles, gave trouble in this way, but I have cured it by smearing a little Seccotine round the joint on the outside and then fitting a circle of asbestos string. This when pressed down by the aid of the valve dome makes a perfect joint.—GEO. GRIBBON.

Improvements in belt fasteners are proceeding apace. Lately we received samples of the D-All improved adjustable fastener, which is supplied complete with three connecting links. These links are of different sizes, and it is thus an easy matter to either shorten the belt by replacing a long link with a short one, or alter the gear slightly as necessary when an adjustable

pulley is used. The insides of the fastener are lined with hardened steel to take up the wear of the rollers at the end of the links. The fastening screws have also been improved. The address of the patentee is J. B. Dall, Commercial Road, Ladybank, Fife.

RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

An American Spring Fork.

The fork blades are extended upwardly, and connected to the steering member B by links C and D. Connecting the links C and D is a cylinder and piston device E, within the cylinder of which are contained springs F, which absorb the vibration. The patent specification describes the invention in great detail, and it is pointed out that by making the cylinder and piston device airtight the cushioning effect of the air within is utilised, in addition to the effect of the springs F.—E.

C. R. Marks (Aurora Automatic Machinery Co.), No. 4,263, 1908.

A Rear Wheel Spring Suspension.

A pair of bell crank levers A are pivotally mounted in the rear fork ends B. One arm C extends horizontally to the rear and carries the back wheel. The other arm D extends vertically downward, and is connected by a fork E to a cross head working in a guide F secured to the chain stays G. The movement of the cross head is restrained in any desired degree by the action of the springs H

and J.—Capt. St. John Hughes, No. 25,016, 1907.

A Live Axle Two-speed Gear.

The wheel A is mounted so as to be free to rotate independently of the live axle B. The pulley K takes the form of a drum secured to the live axle, and is formed with a sun pinion C gearing with the larger pinion D of a compound planet pinion, the smaller member of which (E) gears with a ring of teeth F carried by the hub. The gears are enclosed within a box G. For the high gear the band H, which is

secured to the pulley, is contracted so as to grip the box G, and the drive is direct. To obtain the low gear, the brake band J is contracted to hold the box G stationary, and the

band H now being released, the hub is driven through the sun pinion, planet pinions D and E, and toothed ring F, and a reduced gear is obtained. The specification does not describe the means whereby the bands H and J are to be operated.—A. W. Wall, No. 18,740, 1907.

A Simple Variable Pulley.

The inner pulley flange A is formed integral with a sleeve B, which is keyed to the engine-shaft. The outer pulley flange C is free to slide on the sleeve B, and itself carries an outwardly projecting sleeve D. In this sleeve D are cut a number of notches E of different depths, and with either of these is adapted to engage a peg F fixed to the sleeve B of the inner pulley flange A. By engaging the projection F with notches of different depths, the pulley flanges are secured at varying distances apart, and the desired object accomplished.—J. T. Brown, No. 22,055, 1907.

The Advance Adjustable Pulley.

One flange A is carried by a sleeve B, which is keyed to the engine-shaft. Free to slide on a feather C is the outer pulley flange D, which is locked in position by a ring E screwing on to the sleeve B. To prevent accidental movement of the adjustable flange, a pin F carried thereby is adapted to shoot into one of a number of recesses in the ring E under the action of a spring G. When it is desired to adjust the pulley it is necessary to withdraw the pin F from the recess in the ring E, and for this purpose a lever H is used. This is formed with an inclined plane J, which co-operates with a second inclined plane to withdraw the pin from the recess in the ring E when the lever is moved.—F. Smart, D. H. Gainsford, J. C. Power, and J. Power, No. 21,442, 1907.

An Automatic Carburetter.

This carburetter is of the type in which the jet chamber and the float chamber are put into communication by a pipe in order to equalise the air pressures existing therein. The pipe A communicates with the jet chamber B about the level of the jet nozzle, and with the top of the float chamber C. The top of the float chamber also carries a compound air inlet D, having opposed conical inlets E and F. At low speeds the pressures are maintained equal by this device, but as the speed increases an eddy is set up between the inlets E and F, causing an increasing depression or vacuum in the float chamber, and providing, it is claimed, a constant mixture at all engine speeds by allowing less petrol to issue from the jet at high speeds.—P. G. L. Kreutzberger, No. 25,917, 1907.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London, by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.
York and Lancashire.

SECTION III.

WRITE FOR LISTS.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.

Telephone: 4310. Telegrams: "Primus," B'ham.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

71 GOLD MEDALS.

British Made. Beware of Imitations.

Read testimonials from End to End riders:

"Woolwich, July 22nd, 1908.

"STANLEY DERMATINE MOTOR BELT CO.

"Dear Sir,—I write to inform you of the perfect satisfaction I obtained from your belt in the Land's End to John-o'-Groat's Trial. One belt only carried me from End to End, and to all appearance is in as perfect condition as new. Under the dreadful weather conditions experienced on this ride, it proves your belt, in my experience, a perfect production.

"Yours faithfully,

"J. E. TASSELL."

"Birmingham.

"Dear Sir,—The belt behaved splendidly. I only had to take it up once during the trial (End to End), and it is still in grand condition. I had no trouble with it in the wet.

"Yours faithfully,

"F. C. MUSTARD."

"Sheffield, July 24th, 1908.

"To THE STANLEY WEBB CO.

"Gentlemen,—I used the belt you supplied me with in the End to End, and found it most satisfactory. I had no trouble whatever with it, and only had to take it up twice during the three days' heavy rain. I was not troubled in the slightest with it slipping.

"Yours truly, F. DOVER."

"London, W.

"Dear Mr. Webb,—Thanks for sending me one of your new extra hook-fasteners to Warrington. I found it just the thing for Berridale. I simply slipped out the extra hook, and saved about ten minutes. Again thanking you,

"I am, yours sincerely,

"GORDON GIBSON."

My Ideal Carburetter.

By "IXION."

IN the spring of 1908 a firm of lamp makers set the motor cycle industry a valuable example by inviting riders to suggest points to be incorporated in the design of a new lamp. This precedent was valuable, since the technical knowledge required to design an article which shall be scientifically sound is very seldom combined in one and the same person with an all-round road experience; and thus a man who could not for his very life make out the drawings for an efficient lamp may, nevertheless, be able to suggest a dozen real improvements on a design evolved by a technical expert. I am therefore neither foolish nor conceited when I proclaim my discontent with almost every standard carburetter, and suggest to others who like myself are technically duffers, but use their wits on the road, that we should clamour until we obtain a carburetter that fits our notions.

I made a few remarks on this subject some while ago, but only one maker claimed to have produced a carburetter approaching my requirements, and that was the Amac, which I am now testing, and find to come exceedingly near what I demanded. There are thirteen points, at least, which I should like to find embodied in my ideal carburetter, over and above technical efficiency.

No Small Screws.

Some carburetters of to-day contain three or four tiny screws, acting as plugs or stops, which have shallow beds, and so easily fall out; often, too, these screws are of soft stuff, so that both slot and thread will not survive frequent removals. The Amac has only two miniature

screws, and both are large and strong enough to forbid these troubles.

Simple Caps to Both Chambers.

Some carburetters have their chamber caps secured by four tiny grub-screws, others have large nuts; in some cases the large caps are insufficiently milled to be removable by the fingers, and too soft to take gas pliers safely; on others the removal of the caps disturbs the petrol level, or interferes with the setting of the choke tube. The Amac has a $1\frac{1}{4}$ in. nut for the spray chamber, which can be tackled by a motor cycle spanner comfortably, and does not require a special key. while its removal affects no adjustments; the float chamber cap is milled on the edge $\frac{5}{16}$ in. deep, and its removal does not affect the petrol level. These are good points.

Instantly Detachable Jet.

On certain carburetters you must take off feed pipe, inlet pipe, and several screws to get at your jet, and when exposed, a special key is still required; on others the jet is a driving fit in a stumpy tube, instead of being screwed. Both these systems are radically bad. The Amac, like most of the latest carburetters, falls far short of my ideal in this respect. It requires the removal of the top of the mixing chamber, and finally calls for a special box spanner, while in certain positions the whole carburetter would have to come down. I prefer that the jet should be mounted in a holder, which can at once be unscrewed from the base of the mixing chamber, as on the B. and B. A further refinement is fitted to the Griffon, on which not only is the jet detachable in this

My Ideal Carburetter.—

fashion, but in addition a cleaning broach is incorporated in the carburetter, so that in the event of choking, one has only to lean down and press the broach upwards.

Reversible Floats.

Many carburetters have floats designed only to work when set the right way up. On some the hollow side must be on top, on others it must be underneath. Here the Amac suits me, as it is reversible, and when the duffer or the thoughtless rider has taken it swiftly out, he cannot be in doubt about which side up to replace it.

Damper for Float Needle.

One has only to watch the top of the float chamber on motor cycles possessing a free engine to see that with most carburetters the spirit wells out freely at the top of the float chamber when the engine is running free. What is needed is a damper cap over the top of the float needle to prevent it from jumping up too far under the influence of vibration. The Amac possesses no such device, but like most new carburetters, the Amac has so far not developed this particular fault. Lack of a damper is often the cause of heavy consumption, and on many carburetters there is no real cure for it.

Substantial Needle Point.

The ordinary needle valve suffers from having too small a seat, so that wear has pronounced and immediate effects, and too often the needle is of cheap composition, *e.g.*, I have two carburetters with soft brass needles. The Amac has a very big seat and needle end, and both are of hard German silver—about as suitable a material as could be devised. I shall see later on how they wear, but from tests up to date no wear will occur in less than 2,000 miles.

Throttle Valves, Pistons, or Slides?

Makers are divided on the question whether the gas and air supplies are best controlled by pistons, sliding barrels, or mushroom valves. I am only certain that I loathe hinged discs and leaky sliding collars. Whatever the design, the workmanship of these parts must be beyond reproach. The Amac people use a brace of mushroom-headed valves. These cannot possibly stick up, as pistons may and do, but,

An incident of the T.T. Race. Two competitors, very close together, rounding the corner at Ballacraigne.

on the other hand, dirt on the seats may prevent them closing. I am simultaneously testing a double piston carburetter, and I find the valves distinctly easier to clean than pistons, all that is necessary being to take off one nut, and use a bit of rag, whereas with piston slides the whole device must be dismantled to ensure permanent cleanliness. I find that other makers either have their slides a loose fit originally or else mount them on a spring spindle, so that grit cannot enter and cause leakage. I think the Amac plan is therefore the best I have tried, though I am willing to believe a better may yet be evolved.

Easily Centred Unions.

With most carburetting devices it is difficult to replace the various unions, as the spring of the pipes

R. J. Bell (3½ h.p. N.S.U.), one of the competitors in the Tourist Trophy Race.

sets them out of accurate register when detached. The Amac people have here taken a tip from me, and have cured this trouble in the simplest way. They have merely taken the first thread off each union, and I find this precaution makes it a simple matter to enter the nuts on their threads immediately. Other manufacturers should do likewise, as the expense is nil and the blessing inestimable.

Sturdy Choke Tube.

It might seem ridiculous to mention this, but I had three broken choke tubes in six weeks last year.

Single Aperture Jet.

I have seen tests made to ascertain whether a single jet gave less power than one in which the same area of aperture was split into ten tiny orifices. The power developed was identical with both jets, though it might easily be otherwise if the impinging cone and suction passages were not suitably arranged. This being so, we must demand single aperture jets. They are easier to clean and much less likely to get stopped up than the rose pattern.

Simple Flooding.

We have all known what it was to grope with a gloved hand in cold weather for about $\frac{1}{16}$ in. of projecting float needle. Few carburetters are now so difficult to flood. The Longuemare spring button suffers from the fact

My Ideal Carburetter.—

that in time it wears the float and causes leakage in the top of it. The Amac is sound here, as you press down the tip of the needle instead of pulling it up.

Plenty of Extra Air.

I do not know one single carburetter which supplies enough extra air to feed a well tuned twin when on the road in hot weather, and few afford enough air to suit a fast running single. I always have to enlarge the air holes in summer, and then, of course, they want plugging up again in October. I think the extra air orifices should be much larger, and that both top and bottom air should be adjustable.

Handle-bar Control.

Of course, a delicate setting procured by twisting grips is better than projecting levers, if only the action can be made both quick and delicate.

Minor Refinements.

Why not a variable jet? Why not a petrol filter? Why not a shunt pipe feeding pure air to the engine when the throttle is shut and the machine is coasting? Why not very fine external gauzes to all air intakes, preventing about twenty per cent. of cylinder deposit? Why, on the other hand, have inaccessible interior gauzes, which collect grit, and form a convenient

screen for ice and snow to form upon amid the coldness of condensation?

I shall not actually call the Amac my ideal carburetter until I know whether or not there is another to be had which deletes all the other weaknesses of normal design, and, in addition, possesses a jet detachable with an ordinary adjustable spanner from the outside; but it obviously comes very close to being my ideal, and I shall be interested to hear if there is another device on the market with so many practical advantages.

The A.C.U. Meeting at Leamington.

THE meeting of the Auto Cycle Union Council is to be held at the Regent Hotel, Leamington, on Saturday next, the 10th inst., at 3 p.m.

Agenda.

1.—To receive and pass the minutes of council meeting held on March 21st.

2.—To receive report of the committee.

3.—To consider the following proposition by Mr. E. M. P. Boileau :

That a new class of membership be instituted whereby individual members may be admitted at an annual subscription of 5s.

4.—To consider the following propositions by Mr. S. W. Carty (Newcastle and District M.C.C.) :

(a) That the secretary enter into communication with, or entertain applications from, clubs or individuals who would be willing to undertake the work of organising the centres in the respective districts, as set out below, and further that these centres be in operation on or before January 1st, 1909.

(b) That the centres be appointed into eleven districts, as follows : 1, Northumberland, Durham, Cumberland, and Westmoreland; 2, Yorkshire; 3, Lancashire and Cheshire; 4, Wales; 5, Warwickshire, Hereford, Shropshire, Staffordshire, Derbyshire, Northampton, and Worcester; 6, Lincoln, Nottingham, Leicester, Norfolk, Huntingdon, Suffolk, Cambridge, and Rutlandshire; 7, Cornwall, Devon, Somerset, Dorset, Berks, Hants, and Wiltshire, and the Channel Islands; 8, Sussex, Kent, Surrey, Middlesex, and Essex; 9, Oxford, Buckingham, Hertford, and Bedford; 10, Scotland; 11, Ireland and Isle of Man.

(c) That the Auto Cycle Union enter upon a scheme for uniting the motor cyclists throughout the United Kingdom to obtain an amelioration and mitigation of the conditions under which motor cyclists now labour.

(d) That the third-class return railway and boat fares of all councillors attending council meetings be paid out of the Union funds.

(e) That the councillors and members of the committee representing the private members be elected by postal ballot of all the private members.

(7) That the members of the committee representing the affiliated clubs be elected by the councillors of affiliated clubs, voting either personally or by proxy at the general meeting of the Union.

5.—Any other business.

The council of the Club shall consist of :

(1.) Delegates of private members in the proportion of one delegate for every ten members or portion thereof.

(2.) Delegates of the members who are also members of the Royal Automobile Club in the proportion of one delegate for every ten members or portion thereof.

(3.) Delegates of affiliated clubs in the proportion of one delegate for every twenty-five members or portion thereof.

NOTE.—Under Rules 38 and 39 a councillor has the right to delegate his power to any other councillor, but written notice of such delegation must be received, in the proper form, by the secretary before 5 p.m. on Friday, October 9th.

18, Down Street, Piccadilly. F. STRAIGHT, secretary.

The council meeting will be followed by a dinner at 6.30 for 7 p.m., for which tickets can be obtained at 4s. 6d. each. A smoking concert has also been arranged, and it is to be hoped that secretaries of affiliated clubs will endeavour to make this fixture a success. On Sunday a party will be made up to make a tour of inspection of Leamington.

Of those machines which successfully completed the course in the T.T. Race, in the single-cylinder class Mr. Gordon Gibson's Triumph, and in the multi-cylinder class Mr. Wells's Vindec and Mr. R. O. Clark's F.N. were fitted with Michelin tyres.

Motor cyclists who are contemplating the addition of a non-skid tread to their existing tyres or a change of cover for the winter season should make a note of the Continental Motor Co.'s enterprise, and write for a copy of that firm's latest catalogue of tyres to 32, Rosebery Avenue, E.C.

OCCASIONAL COMMENTS.

By "IXION."

Specification for a 3½ h.p. Twin-cylinder

So many readers have written me respecting the 120 lbs. 3½ h.p. twin-cylinder motor bicycle which I mentioned in the issue of September 23rd that I cannot reply to them all individually. It was not, unfortunately, of any known make, nor do I know of any machine regularly advertised which approaches its specification; but any reader ardently desiring a duplicate of it can easily persuade any good cycle mechanic, experienced in the assembling of motor bicycles, to build him up such a mount. The main points of the specification were as follows: 3½ h.p. twin-cylinder Peugeot engine (a very smooth little power-producer, with a ratio of compression just about correct for real touring purposes), light Chater-Lea frame, Ruthardt magneto, Druid spring forks, 48in. wheelbase, 26in. wheels, 26in. x 2in. ribbed Palmer Cord tyres, Amac carburetter with handle-bar control, adjustable pulley and belt fastener.

This machine may well be worth developing as a separate type by a large maker. Its special advantages over a 3½ h.p. single are that it runs more smoothly, especially at low speeds; there is no thumping when starting or slowed down, owing to there being two cylinders instead of one, and owing to the torque being more even than it is on a single-cylinder engine; the weight can with care be kept down to 120 lbs., as a lighter frame and fittings are possible with this engine than with a big single-cylinder which jerks at low speeds; and, finally, it is remarkably easy to start; accurately adjusted it will fire at a walking pace, and even if parts are slightly out of tune, it is necessarily always easier to start than one big cylinder. I would add the reminder that machines only bearing the transfer of a local assembler often fail to fetch good prices second-hand, whatever their intrinsic excellences.

The Value of Racing.

The other day I was trying to get several keen riders to send their shillings to the T.T. prize fund, and they asked what was the good of racing? Anent which I was able to tell them a true yarn. A certain firm coveted the End-to-end motor bicycle record. They picked a good machine out of stock, chose a good man to ride it, and saw that he practically lived on the roads until June—the record breaker's best month—approached. During this time he found little that called for improvement in the machine, so he was duly timed away from Land's End, and as the weather happened to be perfect both North and South, his employers confidently awaited a wire informing them that five or six hours had been pared off this already attenuated record. Instead, they received per passenger train a machine that was more than half a wreck; and, as the result of that one test at sustained speed, they made radical alterations in their distribution gear, ignition, carburation, and many detail fitments. This, although

the aspirant failed to cover a distance equal to the length of the T.T. course. Nothing in the world brings weak points of design and construction into relief so quickly and so surely as sustained speed. Hence the T.T. race.

A Sweating Petrol Tank.

A Dorset rider desires to know why manufacturers sometimes construct petrol tanks with "buted" joints, in lieu of capped or lapped joints. He says a mysterious case of excessive petrol consumption came under his notice, and after all other causes had been eliminated, it was found that the tank was sweating minute beads of petrol along the entire length of a "buted" joint.

The third arrival in the Tourist Trophy Race (Multi-cylinder Class) was R. O. Clark, who is depicted above on his four-cylinder 5 h.p. F.N. His average speed was 37.7 miles per hour, and petrol consumption 90.8 miles per gallon.

The same rider says he has increased the gallon mileage of his 1¾ h.p. F.N. from 120 to 160; chiefly by fitting a needle controller, which limits the movement of the needle. Something of the sort is fitted to the latest Phoenix cars. Mr. Hooydonk once published a make-shift device for Longuemare carburetters in our columns, the sole defect of which was that there was no lock for the adjustable needle cap. He now drills the cap centrally, taps the hole, and uses a set screw and lock nut to control the needle. In this connection I may remind readers that whenever a leak in a float has been soldered up, the petrol level may require re-setting, as the weight of the float will possibly have been increased. Generally speaking, it is a mistake to attempt the soldering of a float one's self. Only those accustomed to delicate soldering operations, such as a first-class tinman or silversmith, should be entrusted with so fine a job.

With regard to our recent article, "Is the Tricar Dead?" we have read an interesting letter from a medical gentleman who has been using a Phoenix Cob converted to a tricycle in his practice. The machine is employed almost every day as a runabout, and has given every satisfaction.

Waiting for the Silencer Test. To test the silencers of the Tourist Trophy machines, before the race, the competitors were instructed to drive past the judges at St. John's one by one at full speed with open throttle.

THE STEVENSON VALVE SPRING LIFTER.

RAPID and easy removal of an exhaust or inlet valve is a great convenience, and although there are many tools on the market specially made for the purpose, few of them fulfil the requirements of such an instrument, viz., interchangeability, rapidity of action, and smallness. The latest

A new valve spring lifter, patented by Mr. Stevenson, of Coventry.

description of valve spring lifter submitted to us is the Stevenson, patented by a Coventry motor cyclist of that name. The illustration of the device is fairly explanatory, but we may enumerate its various advantages, and also point out that it has been purposely made wide to allow it to be used on practically every standard motor cycle engine on the market. It is also adjustable vertically, holes being drilled in one of the bars to take a set pin seen in the lower lug or strap surrounding the two bars. Its chief advantage lies in the fact that the cylinder or crank case is not relied upon for support, the fulcrum resting on the top of the valve itself, so holding the valve down. The short lever is prong-shaped at the end, and pivots on a hook at the base of the fulcrum. The size is $6\frac{1}{4}$ in. long when telescoped to shortest length, and it will lie flat in an ordinary tool roll.

HIGH SPEED ON A SIX-LAP TRACK.

OUR illustration shows Jake De Rosier, taken on the Stadium track at Clifton, N.J., where he has been making some remarkable exhibitions of riding. The Stadium is located in the State of New Jersey, about fifteen miles from New York. It is a six-lap board track, banked at the turns to about 50° . Although the curves are carefully planned, at anything like a mile a minute gait the riders experience a severe shock on the turns, and this makes sustained speed practically impossible for distances over five miles, the physical strain being too great. In a five miles event De Rosier's time for a quarter of a mile was $13\frac{1}{5}$ s., half a mile $27\frac{3}{5}$ s., one mile 56 s., three miles 3 m. 1 s., and five miles 4 m. $52\frac{1}{5}$ s. These times are certainly wonderful in view of the conditions under which they were accom-

Jake de Rosier, who covered five miles in 4 m. $52\frac{1}{5}$ s. on a six-lap track.

plished. The machine shown is an Indian racer of 7 h.p. It is driven almost entirely on the spark, which is controlled by the right handle grip, while the throttle is directly on top of the carburetter, and is thrown wide open after the machine is well started. The chain drive is direct from the engine to the rear wheel, but the rear sprocket is made with a species of automatic friction clutch, which overcomes all sudden shocks.

Questions & Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E. C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Engine Firing After Switching Off.

?

Can you explain why the engine of my motor cycle continues to fire irregularly for a few explosions, even after I have switched off the ignition? I have carefully gone over the wiring, and the low tension wire to switch has been renewed. I may say this has only occurred lately.—B.K.

If the connections are good, clean, and sound the trouble is probably not due to the switch, but owing to the fact that the engine is slightly over-heated when you stop, and consequently fires automatically. Probably the cylinder requires to be removed, and the combustion head and piston cleaned of carbon deposit. Some engines have a habit of firing after switching off, but if you close the throttle, further explosions cannot occur.

Using a Telephone Magneto.

?

I have tried to fix to my motor cycle a magneto out of a telephone box, which I have altered in several places. I have tried different ways with it, and in each case have got a very good spark. I am working on the old contact breaker which I use with the accumulator, and drive from the engine pulley by a chain to the cog-wheel on the front of it, and so to the magneto. Could you inform me the reason of not being able to get a slow speed by altering the spark lever? Where I have the spark lever for slow speed when using accumulator, in the same position with magneto the engine goes at a very fast speed. When I try to advance the lever the engine slows down and then stops. After the engine has been working a little time I find explosion chamber has a lot of lubricating oil in it, and after a time it comes out of the silencer. I have tried driving the magneto at the same speed as the contact breaker, but that seems too slow. What is wrong?—C. HAWKINS.

In the first place, the magneto is absolutely unsuitable for ignition purposes. The fact that an engine runs faster with a magneto is due to the absence of lag. Owing to its design the spark advance of a magneto has only a very short range, so that it practically prevents the spark advance being used. What surprises us most is that you got any results at all.

A Mysterious Knock in Engine.

?

My 3½ h.p. Brown engine has just been cleaned out and rebushed throughout. The compression is very good, and the machine goes well. After I have been running half a mile or so a mysterious knocking takes place. A knock occurs every few seconds, but not regularly, and is very bad if I attempt any rise at all. I have taken off the Longuemare carburetter originally fitted to the engine, and have replaced it by a B. and B., but I don't think that the carburation has anything to do with the trouble.—G.C.

Your trouble sounds like pre-ignition, due to excessive carbon deposits. Have you tried a change of sparking plugs, and are you sure that the magneto is set right? Carefully check the timing. When the contact breaker is retarded the points should begin to separate when the piston has reached the highest

point of the compression stroke. When new bushes have been fitted it is advisable to be liberal with the oil supply for a time.

Unequal Lubrication.

?

My 4½ h.p. twin Minerva engine appears to me to suffer from want of lubrication in front cylinder. My reasons for thinking such is the case are: (1.) Front plug is scarcely soiled, whereas back one is like plug was on single-cylinder machine. (2.) I find front cylinder does not fire until machine has run a little distance, even after changing about connections to coils, and also the plugs. Machine has run over 1,000 miles.—

IN DOUBT.

It is always difficult to lubricate a V-twin-cylinder engine equally in both cylinders. It is, therefore, best to effect a compromise, and to oil so that one cylinder gets a little too much and the other sufficient.

A scene of activity before the start of the T.T. Race. The competing machines are at their allotted stations, and the petrol for the first half of the journey is being doled out, the tanks afterwards being officially sealed.

How to Adjust a Coil.

? Kindly let me know what is likely to be wrong with my motor cycle? I have a Bassée-Michel trembler coil, and the engine misfires badly, especially at high speeds. On taking the plug out I get a good spark if I lay it on or near the cylinder, but on putting it in the air away from the cylinder I get a practically invisible one. I suppose the plug ought to give a bright spark away from the engine. The wiring, accumulator, and plug seem to be all right. I have tried two plugs with the same result. Do you think the coil is at fault?—D.W., Stockport.

Misfiring at high speeds is likely to be due to either the trembler of the coil not vibrating fast enough or to the carburetter not receiving sufficient air at high speeds. The coil should be adjusted as follows: Take out the screw and trembler blade, and using a fine jeweller's file make the contact points quite flat and clean. If the platina have worn away you can have the points replaced. Adjust the trembler with the engine running, and make the adjustment as light as possible. Unless you place the plug on the cylinder or some metallic part of the machine, you will get no spark, as you must have an earth return through the lower metal portion of the plug.

Restoring Power to an Engine.

? My 3½ h.p. Triumph has in several months' running lost some of its power, and there seems to be an absence of "kick" in the engine, even when running on the stand. I have had the exhaust valve ground in, thinking the compression was getting weak, but there is little or no improvement. Although it climbs hills well it does not go at the pace it used to do. I am a novice and shall be glad to know if I can do anything to restore its utmost power, or whether I must get a repairer to tune it up for me?—S.H.

You can improve the running of your machine by first of all cleaning the carburetter and petrol pipe. Then take off the brass cover of the magneto, and examine the platinum points, and if they show traces of pitting, clean them with a jeweller's file, making sure you leave them both perfectly flat. If there is oil on the contact breaker and also behind it, undo the centre screw by the special spanner provided, and the contact breaker complete can then be prized off. Clean away all traces of oil and replace. Now notice how much the contact points separate. The correct distance is .5 mm. If they hardly separate at all it is a sign the fibre ring is worn and requires replacing. A temporary cure can be made by filing the ring to cause the contacts to break more suddenly. The high tension terminal should be taken out and the end of the carbon cleaned with sandpaper. Give the engine crankcase a good swilling out with paraffin, and the power should return. Remember that the cylinder should be removed about every 1,000 miles to scrape away the carbon deposits, which cause overheating.

Various Queries from a Novice.

? (1.) What speed should a 2½ h.p. motor bicycle in fair condition, geared 5 to 1, attain on the level, and what gradient should it be capable of mounting unassisted? Would it be capable of drawing trailer with eight stone passenger on fairly level roads? (2.) Is 100 a good mileage to get out of one gallon of petrol, and what amount of lubricating oil should be used in the engine for the same distance? (3.) How many miles should a fully charged accumulator run? (4.) Are there any legal restrictions with regard to the use of cut-outs?—C.W.

oil (obtainable from A. W. Gamage, Ltd.), putting the dressing on over night and not just before starting a run. Any kind of oil is better than allowing the clutch to get dry and fierce. Castor oil is a good substitute for Collan oil. (2.) Say every 1,000 miles or so, and more often in winter if it has been covered with mud from wet roads and allowed to get rusty. After removing the chain allow it to soak in paraffin in order to thoroughly clean it. Then heat the chain in an oven, and afterwards immerse it bodily in melted tallow. The noise is most probably due to both wear and want of lubrication.

Tourist Trophy Race officials at the starting and finishing line. Reading from left to right: Messrs. F. Stralght (secretary), C. P. Glazebrook, A. V. Ebbelwhite, J. S. Mallam, F.C.A., R. A. Tyler, A.C.A., and Robert Todd (chairman). Photograph kindly sent by Frederic Coleman.

(1.) A machine such as you describe should attain about thirty miles an hour on the level, and would draw a trailer on level roads. (2.) One hundred miles to the gallon is very good. We cannot tell you how much lubricating oil would be required. This depends upon the individuality of the engine, some engines requiring more than others. (3.) It depends upon the size of the accumulator, a 20 a.h. should last 600 miles. (4.) Unfortunately there are no legal restrictions as regards the use of a cut-out.

Fierce Clutch and Attention to Chains.

? (1.) The leather to metal cone clutch on my tricar is very fierce, and I am afraid of breaking the chain in starting. Kindly tell me how to make the leather softer and the best dressing to use? (2.) How often should the driving chain be taken off for lubricating purposes, and what is the best oil to use? The hissing noise from the chain seems to have got worse lately. Is this due to wear or want of lubrication?—J.H.B.

(1.) First swill the clutch leather with paraffin and then dress it with Collan

READERS' REPLIES.**Pre-ignition with 3½ h.p. Minerva.**

Referring to query by "N.B.," Westfield, in a recent issue, I should like to state that I have had exactly the same trouble as that referred to with my 1907 3½ h.p. Minerva, and you have given the correct solution to the trouble by advising him to slightly lower the compression ratio. When dismantling cylinder to remove carbon deposit I took out the packing between cylinder and crankcase fitted by the makers, thus rendering the compression ratio slightly higher. It is wonderful what a great difference a washer, say 1-16in. thick, makes. I got three pieces of stout cardboard, soaked them in boiled oil, and now I have fitted these I can do forty miles with three-quarter gas, and afterwards sail up a very steep hill without the slightest sign of pre-ignition, even when the carbon deposit is thick on both piston and cylinder head. I suggest a gear ratio of 5¼ to 1, even for flat country. A 10 spray jet with 22 mm. air adapter I find the best combination.—W. R. DAVIS.

MOTOR CYCLE TYRES.

Tyres form a most important part of the equipment of any motor cycle, and the strength and quality should always be proportionate to the weight to be carried. The larger the tyre in proportion to the weight, the greater immunity from punctures, is a well-worn axiom. A common fault with makers is the under-tyring of motor cycles. This practice is not only the reverse of economical, —since large tyres protect the mechanism from vibration and road shocks, and of course wear longer than small tyres—but is a source of discomfort to the rider, and may, in the case of a sudden burst through fitting too thin a cover, be fraught with danger. The following illustrated article has been prepared with the idea of providing our readers with some definite data to go upon when purchasing a new machine, or making any change in the style or size of tyres with which their mounts are shod. Practically all the best makes of motor cycle tyres are dealt with in the article, but if there are any omitted it is because we are unacquainted with the names of the manufacturers, or they have failed to respond to our application for sample sections and particulars.

THE AVON INDIARUBBER CO., LTD., Melksham, Wilts., who have made such good use of their proximity to Stonehenge in their advertisements of late by depicting various motoring scenes at the time of the stone age, supply motor cycle tyres in all standard sizes, viz., 24in., 26in., and 28in. by 2in., 2¼in., and 2½in., either wired or beaded edge. The air tubes can be supplied either endless or butt-ended. Our illustration is that of a section of the heavy, extra strong beaded edge cover; with this is supplied a standard red quality inner tube. A pair of these tyres are at present undergoing a test at our hands on the front wheels of a light passenger three-wheeler. Among other goods of interest to motor cyclists, manufactured by the same firm, are motor cycle plasters for effecting temporary repairs to a damaged cover; also motor cycle patches.

W. AND A. BATES, LTD., St. Mary's Mills, Leicester, make motor cycle covers in two weights, namely, ordinary and heavy, and also make a tricar tyre. They do a large trade in these tyres, and as they are made of a special hard rubber suitable for motor cycle work, they give every satisfaction. With regard to sizes for different weights of machines and riders, the firm say that they usually leave this to the user.

For single-cylinder machines of 3 h.p. THE CONTINENTAL TYRE AND RUBBER CO., LTD., 102-108, Clerkenwell Road, E.C., recommend the standard pattern motor cycle tyre, which is supplied in all sizes for 24in., 26in., and 28in. wheels; the 26in. and 28in. sizes can also be supplied with wired edge if required. For twin-cylinder machines of high horse-

power, such as 5-6 h.p., the Modèle de Course pattern is advised; this cover has an extra heavy tread fitted, and as canvas is used as a foundation for this tyre, it makes it very strong and durable. In addition to the two patterns above mentioned, a rubber non-skid is made; this tyre has only been put on the market lately, and those who have used it, including competitors in the End-to-end, have expressed their entire satisfaction with its behaviour. Out of twelve

riders who used these tyres ten obtained medals—eight bronze and two gold medals—whilst two were not fortunate enough to finish. The firm is also in a position to supply, if required, a steel-studded tyre in 24in. and 26in. sizes, and a steel-studded cover with leather tread. For tricars a 26in. by 3in. is recommended, and has been found very suitable, or if the tricar is very heavy a car tyre, Pattern III. is best.

CAPON HEATON AND CO., LTD., Stirchley, near Birmingham, make two types of motor cycle covers. The one with beaded edge has three stout ridges on each side of the tread, which greatly prevent side-slip; the wired edge has a fluted tread. They are made in 26in. and 28in. by 2in., 2¼in., and 2½in. This firm also make a speciality of supplying motor cycle non-slipping shields with specially roughened backs to take solution, and also vulcanise plain treads to existing covers.

Motor Cycle Tyres.—

THE COVENTRY RUBBER Co.'s speciality is a non-skidding tread which retains its anti-slipping advantages until the centre portion is worn down right to the canvas. These tyres are produced in 26in. by 2in. and 2¼in. sizes, and deliveries of the new pattern cover, which we illustrate, can be made in a few days. It is interesting to note that, although the company have sold the ordinary pattern tyre since the early part of last February, they have only had two covers returned to them for repairs.

THE LIBERTY motor cycle tyre made by Components, Ltd., Bournbrook, Birmingham, is noted for strength and durability, whilst its section shows that it possesses the desirable quality of non-liability to skid. Only the purest Para rubber (Cauchou) is used in the manufacture of this tyre, and the quantity is not stinted. The necessity of best quality in rubber for motor tyre

LIBERTY WIRED-ON COVER.

LIBERTY BEADED EDGE COVER.

manufacture is one that has long been recognised by Components, Ltd., and anyone who has seen the difference between the solid meat-like slabs of rubber imported from the Amazon and the rag-like appearance of some of the inferior kinds of rubber coming from the West Coast of Africa and other districts will understand how it is that Liberty tyres have achieved such a reputation for durability. Liberty motor cycle tyres are made in both wired and beaded edge varieties and of 2in. and 2¼in. sections.

THE B.F. GOODRICH Co., 7, Snow Hill, E.C., are the pioneers of the rubber studded tyres and the holders of the patents for this type of non-slipping cover, which is made in one size only—26in. × 2¼in. They will, however, fit all rims, which is an advantage to those riders who have machines so worn and desire to try the non-skidding properties of the rubber-studded tyres during the coming winter. We have personally used them for several hundred miles, and were unable to detect any slowing effect due to the

GOODRICH RUBBER STUDDED COVER.

rubber studs, although it is claimed by some that rubber studded tyres slow a motor cycle both in speed and in hill-climbing. The inner flap of the cover is very useful and necessary, for it prevents the tube being nipped.

THE DUNLOP PNEUMATIC TYRE Co., LTD., 14, Regent Street, S.W., and Aston Cross, Birmingham. Readers in search of speedy tyres should not forget

DUNLOP BEADED EDGE COVER.

DUNLOP WIRED-ON TYRE.

that Dunlop tyres were fitted to the winning machines in the T.T. Race, both single and twin-cylinder classes. In addition to being speedy, Dunlops are both well made and reliable. For the driving wheel of the heavier and more powerful motor bicycles, tricars, and quads a small motor car tyre is recommended. Dunlop tyres are made in both wired and beaded edge, the former is favoured for path-racing purposes and the latter for touring and ordinary road riding. The wired-on type, although more difficult to remove from the rim than the beaded-edge, is safer when a sudden burst occurs, as the endless wires which are fitted in the canvas pockets at the sides of the cover cannot leave the rim without the application of a tyre lever. These tyres are supplied in the following sizes: 26in. and 28in. × 2in., 26in. and 28in. × 2¼in., and 26in. and 28in. × 2½in. The Dunlop Pneumatic Tyre Co. quite wisely wish to impress upon motor cyclists the importance of fitting the largest possible tyres in proportion to the weight and power of their machines.

The 1908 Shamrock-Excelsior rubber studded tyres made by THE HANOVER RUBBER COMPANY have met with such universal approval that practically no alterations will be made for 1909. These tyres are made to fit almost all existing rims, especially the Clincher rim, in all 26in. sizes. The sizes are 24in. by 2¼in. and 2½in., 26in. by 2in., 2¼in., and 2½in., and 26in. by 1¾in. light-weight; 28in. are not made. This firm favours a wide rim as used by most Continental manufacturers, and asks us to point out that the narrowness of some rims prevents the adoption of an extra strong casing, which is absolutely necessary for high powered machines. It recommends all motor cyclists when ordering a new mount for 1909 with S.E. tyres to specify these rims. For tricars a studded light car tyre is recommended, which is made in sizes 2½in., 3in., and 3½in. by 26in.

SHAMROCK EXCELSIOR RUBBER STUDDED COVER.

Motor Cycle Tyres.—

We have pleasure in testifying to the excellence of these tyres, which have given us entire satisfaction during this year. A cheaper tyre made by the same firm is the Auto (corrugated). This is made in the same sizes as the S.E. studded tyre with the exception of the 20in. by 1½in. lightweight. In addition to the usual jointed inner tubes, the Hanover Rubber Co. supply butt-ended inner tubes. Shamrock-Excelsior tyres have been uniformly successful in 1908, being particularly well represented in all the important road competitions.

THE MICHELIN TYRE CO., LTD., 29, Sussex Place, W. Known all over the world as makers of high class motor tyres, the Michelin motor cycle tyre can be relied on as a suitable article for motor cyclist's use. Concerning the interchangeability of motor cycle outer covers, it is interesting to

note that the Michelin is interchangeable to the following extent: The 1½in. wired-on cover will fit a 1½in. rim; the 1½in. beaded cover will do likewise; 2½in. and 2½in. wired on covers will fit 2in. rims, and 2½in. beaded covers will fit 2in. rims. The 2½in. and 2½in. beaded-edge covers require special rims. The motor cycle Michelin-

semelle non-skid tyre is a reduced facsimile of the firm's non-skid car tyre, used with such success in many competitions. The studs, which are of hardened steel, project through a substantial leather tread vulcanised on to the cover, while behind the studs there is a thick leather strip, which effectually prevents the studs from penetrating to the cover. These non-skids are made with wired-on and beaded edges, and in the case of the latter a flap is fitted to prevent the tube from being nipped.

THE NORTH BRITISH RUBBER CO., LTD., Castle Hills, Edinburgh, are the makers of the famous Clincher tyres. These tyres are made in several qualities—the A Won is the ordinary motor cycle tyre, the Dreadnought is a thicker cover for powerful machines and light passenger work, while the new introduction is a rubber studded tyre which is illustrated herewith. The A Won is made in 26in. and 28in. × 2in., 2½in.,

and 2½in. The Dreadnought in 24in. and 26in. × 2½in., and the rubber-studded in 26in. × 2½in. only. The last named tyre was used by Mr. Arthur W.

Bentley on his Triumph when he broke the End to-end record last June. For heavy passenger work, such as tricar hack wheels, a light voiturette tyre is recommended. This is made in sizes 650 × 65 mm. and 700 × 75 mm. = 26in. × 2½in. and 28in. × 3in. Both these fit the same Clincher rim.

THE PALMER TYRE, LTD., 110-123, Shaftesbury Avenue, W.C., who are one of the most popular makers of motor cycle tyres, pay special attention to supplying the wants of their motor cycling customers. The chief qualities of Palmer tyres are their extremely heavy tread, fitted with long and substantial ribs which are most effective against side-slip, and their patent Airless Cord, which takes the place of fabric, and gives enormous strength to the tyre. Palmer's have lately introduced an internal flap which prevents the tyre from being nipped, while a special 2½in. tyre is now made to fit a

Palmer 2in. rim. Motor cycle tyres are made in the following sizes: 26in. and 28in. × 2in.; a special tyre, 26in. and 28in. × 2½in. for the 2in. rim; a standard 26in. and 28in. × 2½in. for 2½in. rims; and tyres of 24in., 26in., and 28in. × 2½in. It will thus be seen that all weights, powers, and types of motor cycles are adequately provided for. The fabric tyre is still made, but the Palmer Tyre, Ltd., strongly recommend their Cord motor cycle tyres for the more powerful machines, and particularly for passenger work with a sidecar. For heavyweight tricars, small car tyres are recommended.

THE PETER UNION TYRE CO., 6, Upper St. Martin's Lane, W.C., have long made a speciality of motor cycle tyres, being one of the first Continental makers to establish a London office and warehouse. All P.U. tyres are of the beaded-edge type, and are supplied in 24in., 26in., and 28in. × 2in., 2½in., and 2½in. The covers are made with ordinary ribbed, basket-pattern non-skid, and steel studded non-skid treads. The latter are now made by inserting the steel studs into a leather band, which is attached to the cover by a special process. The reinforced cover is a very strong and reliable article, and there is a big demand for it, particularly for the driving wheels of high powered twin-cylinder motor bicycles and tricars. The Peter Union puncture-proof band is a band of specially hard rubber with finely bevelled edges. This band fits between the cover and air tube, and protects the latter against

outward influences in the shape of nails, pieces of glass, etc. It also prevents the heating of the air tube, by insulating it from the heat usually communicated to the tube by the cover, and caused by the frictional contact of the cover with the road during a fast ride.

RUBBER WATAWATA

shares most of the qualities of the Leather WATAWATA, and is well in advance of all other composition belts.

LONDON:

W. B. BROOK, 318, KING STREET,
HAMMERSMITH, W.

.. THE ..

LEATHER WATAWATA

is the greatest of power economisers, and possesses most wonderful tenacity and durability.

WHICH WATAWATA ?

Whether you be in favour of a composition belt or a leather one, you cannot do better than choose a Watawata. Durability, strength of grip, and wastage prevention, are features of both belts owing to the scientific lines on which they are constructed. Another point about the modern Watawata, is the hook fastener which permits of quick and easy shortening.

Belts in Rubber or Leather are the most efficient made.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

Motor Cycle Tyres.—

THE SELF-SEALING RUBBER CO., LTD., Hermetic Works, Ryland Street, Birmingham, as their title implies, supply a special air tube with self-sealing properties; also a detachable air tube with the Hermetic joint. In addition, they market a complete tyre called the Hermetic extra heavy motor cycle tyre. This is made in 24in. \times 2¼in., 26in. and 28in. \times 2in., 2¼in., and 2½in. The tread is a registered zig-zag non-slipping pattern, which forms the subject of our illustration; a fluted tread can also be supplied. For tricycles the company recommend the use of a car tyre for the driving wheel, and the zig-zag or fluted type for the steering wheels. For light motor cycles the same tyres as are above described are made with wired and beaded edges in the following sizes: 26in. and 28in. \times 1¾in., 2in., and 2¼in. These light tyres are frequently specified for the front wheels of motor bicycles, with extra heavy tyres for the driving wheels, and the combination gives most satisfactory results.

**An Automatically Variable Pulley.**

ONE day last week we had an opportunity of testing a new automatically variable pulley, which has been patented by Mr. Lloyd, of the Lloyd Motor and Engineering Co., 132, Monument Road, Birmingham.

The device consists of a fixed pulley flange A, which is keyed to the shaft B. Turned solid with the fixed flange is a sleeve C in which are slots D D. There are three of these slots situated at equal distances around the circumference of the sleeve C. In the sectional illustration two have been shown for the sake of simplicity. The loose flange E also carries an extension or sleeve H in which a fork will be placed to operate the sliding flange when a free engine is required. In the sleeve H are tapped holes in which studs are fixed. These studs take the pressure of the coil spring J, the spring being kept in constant compression by the cap nut K, which screws on a thread formed on the end of the spindle B. Mounted on the sleeve C of the fixed flange A is a ball bearing L, which receives the belt when the pulley flange is opened wide enough to allow it to drop on to the top of the ball bearing. In this manner a free engine is obtained after the engine has been started by means

Section of the Lloyd pulley.

of the pedals. The machine we tried was not fitted with a free engine device, and the pulleys will be supplied with or without it as desired.

At first sight one naturally asks what becomes of the slack of the belt when the pulley flange opens and the gear is lowered? It is only natural to expect that under such circumstances the belt would commence to slip, but from actual riding experience we are in a position to prove that it does not slip to any appreciable extent, if at all. The reason why the belt does not slip when slack is because the coil spring is always exerting an even pressure on the loose flange.

Mr. Lloyd handed a machine to us with a top gear of about 3½ to 1, and so adjusted that the pulley flange would open sufficiently to give a gear of 5½ to 1. On starting the machine by running alongside and mounting by the pedal the first two or three explosions occurred with the high gear in action, but the moment the engine felt the weight in the saddle and had extra work to do, the pulley flange automatically opened and lowered the gear, closing again gradually as the machine gathered way.

Arrived at the foot of Mucklow Hill, on the road between Birmingham and Halesowen, the machine took the rise in excellent style. Now we know from previous experience that a 3½ h.p. motor bicycle has not taken the writer, who weighs about 13 stones, up this hill with a gear of 3½ to 1 without some pedal assistance or rushing the hill, which on this particular occasion was impracticable owing to traffic. At the commencement of the rise the pulley opened but slightly. On the steepest gradients it was distinctly noticeable that the gear was reduced to about 4¾ or 5 to 1, and on reaching a more level portion about midway the gear again rose to about 4 to 1, automatically lowering itself on the steepest gradient at the finish and again rising as it came over the brow of the incline.

The machine was an ordinary 3½ h.p. L.M.C. motor bicycle, which has been in use for more than twelve months, and has probably been ridden over 15,000 miles, as it is the firm's test machine and was the first one built by Mr. Lloyd before the Stanley Show of 1907. The belt was a ¾in. Lyso, which, as our readers know, is made of canvas and rubber. Mr. Lloyd, however, assured us that leather belts, if sufficiently flexible, such as the Watawata or Stratex, would grip equally well.

Unless a free engine is desired in conjunction with it there is absolutely nothing for the rider to do in the way of operating the flange, which opens and closes according to the power exerted by the engine and the resistance met by the machine on varying inclines. In addition to trying the machine ourselves we saw it ridden up a hill near Halesowen, which is situated on a bye-lane, the gradient of which cannot be less than 1 in 5. Even with a rush it is generally impossible to climb such a hill with a gear of 3½ to 1, so that the pulley must act perfectly and without undue slipping or the rider could not have surmounted it. We also understand that a prominent Birmingham motor cyclist has made better time on Rose Hill with this pulley than he could do with a fixed gear of 4½ to 1.

We must say that the results of the short trial left us with a most favourable impression of the simplicity and automatic action of the pulley, and readers can confidently expect to hear more of it in subsequent issues.

CURRENT CHAT.

SPECIAL FEATURES.

MOTOR CYCLE TYRES.

BROOKLANDS MOTOR CYCLE HANDICAP.

A.C.U. PENALTY RUN.

TIME TO LIGHT LAMPS.—Oct. 7th, 6.26 p.m.; Oct. 10th, 6.19 p.m.; Oct. 14th, 6.10 p.m.

A Seasonable Topic.

Next week's issue will contain a special illustrated article on lamps for motor cycles.

A Correction.

We have been asked to point out that H. V. Colver did not run out of petrol in the T.T. Race as was stated last week. His consumption was at the rate of 85.1 miles per gallon, his sole trouble being due to a burst tyre.

A Tourist Trophy Note.

C. R. Collier, who finished second in the T.T. Race (single-cylinder class), employed a Brown and Barlow handle-bar-controlled carburetter on his $3\frac{1}{2}$ h.p. Matchless J.A.P.; in fact, both the Colliers used this new model carburetter, and were well pleased with the results obtained.

Yorkshire Police Traps.

A 220 yards trap is working on Roundhay Road, Leeds, between Harehills Lane and Kitson's Rest; another same distance at Moortown, Leeds, between Chained Bull Hotel and cross-roads; one on Leeds and York Road, *via* Tadcaster, at cross-roads. Another 220 yards trap on York and Leeds Road, three miles from Wetherby, and yet another on the same road commencing at seven miles stone from York, which also includes cross-roads.

Audible Warning.

The case against the Rickmansworth motor cyclist for not giving audible warning, although he was riding a twin-cylinder motor cycle *with the cut-out open*, was dismissed at Wareham, Dorset, on payment of costs. Another rider was less fortunate. He was fined for crossing the crown of Wareham Bridge without blowing the horn. The bridge at this point is alleged to be dangerous, although at the time of the incident there was no traffic upon it. It would appear that the police are not particular about noise, as long as they can secure a conviction for not giving audible warning. This is no inducement to motor cycle makers to make their engines less noisy, and is a distinctly farcical proceeding. We are positively certain that the public do not wish to hear constant horn blowing. There is also considerable doubt about the legality of such a conviction. The Act says "whenever necessary." If it is constantly necessary, according to some magistrates, a perpetually blowing horn or whistle appears to be the only remedy.

The Next A.C.U. Quarterly Trial.

The quarterly trial to be held on Saturday week, the 17th inst., will bring the competition season of 1903 to a close. The usual course from Uxbridge to Banbury and back will be followed, and the competitors will be timed on Dashwood and Amersham Hills. Entry forms can be obtained from the A.C.U. secretary at 18, Down Street, Piccadilly, W.

Another Motor Bicycle Stolen.

On the 26th ult. a "fair" man with a foreign accent (evidently a German or Russian), slight moustache, age about 25, height 5ft. 7in., well dressed, called in answer to an advertisement of Mr. W. Bloomfield, 186, South Lambeth Road, S.W., of a 1907 twin Rex de Luxe. He asked to try the machine, turned a corner, and has not been seen or heard of since. Any reader giving information to Mr. Bloomfield leading to the recovery of the machine will be well rewarded. The motor cycle is a standard '07 twin Rex with Roc clutch, aluminium finish.

Tourist Trophy Race.

Mr. William Heaton has asked us to mention that the reason of his retirement in the fifth circuit of the above race between the Devil's Elbow and St. Germain after covering seventy-four miles was because of a broken connecting rod and piston. He did not ride his own machine in the race.

Ran Out of Petrol.

The gold medal presented by the Rex Motor Mfg. Co., Ltd., for the best performance of a private entrant on a Rex machine was won by A. J. Moorhouse, who ran out of petrol a few miles from the finish.

The Marathon Race on Saturday.

One of the earliest motor cyclists in the London district, and one of the first members of the Motor Cycling Club, Mr. W. G. Weekes, is officiating as chief judge in the great Marathon race (first prize £100) from Windsor to the Stadium—a distance of twenty-six miles—on Saturday, the 10th inst. On this occasion he will naturally act in the above capacity on a pedal cycle.

The T.T. Race. A Rex rider crossing Baillig Bridge at full speed.

Police Traps.

There is a measured quarter-mile on the main road between Bolton and Horwich

A Hill-climb Abandoned.

The open hill-climb of the Bradford M.C.C., which was on Saturday's programme of motor cycle events, was abandoned at the last moment owing to lack of entries. Next year, at a more favourable time, a similar event will be held. We much regret that the conditions and particulars of the classes were not received in time to be published in these columns, which probably accounts to some extent for the scarcity of entries.

Petrol Gauges.

With regard to the recent reference to petrol gauges in our leaderette in last week's issue on the Motor Cycle T.T. Race, Mr. A. C. Davidson, the well-known inventor and constructor of these devices, recently called at these offices and pointed out that had the users of his gauges in the race fitted them according to his advice they could be easily seen from the saddle. In the Davidson gauge catalogues there are two models which are easily visible, namely, types 1a and 2. In the first-named the gauges are set in the tank at an angle, and if the rider inclines his head to the slightest extent he can easily see the quantity of petrol he has left, while type 2 is especially suitable for such a race as the T.T., as it shows the level of the fuel down to the last drop, and if the glass is turned towards the rider he can see how his consumption is going on at a glance.

In writing the leaderette above referred to we failed to remember these two models of gauges, and now that their good points have been emphasised, motor cyclists will be glad to know that what we wrote of as being a benefit as yet unattained is one which is actually within the reach of all.

The Brooklands Winner.

Gordon Gibson, who won the Brooklands 5½ miles handicap race on Saturday, retained the mudguards on his T.T. Triumph, although, according to the regulations, they were not necessary, and, in fact, were removed by the majority of the competitors. The winner's engine has a higher compression than the standard 1908 engine. Biberdum used his influence in the race, for both first and second were on Michelin tyres.

Fined for Excessive Speed.

For driving a motor bicycle at an excessive speed at Shooters Hill Road, S. H. Turner, of Charlton, was fined £5 and 2s. costs at Greenwich last week. On being informed that the offence was committed at night, and that the speed was upwards of twenty-eight miles per hour, the magistrate said: "It is monstrous. What will happen if you people go on as you are doing is that there will be some reactionary legislation which will ruin the industry."

Motor Union Annual Dinner.

It is proposed to hold the annual dinner of the M.U. on Wednesday, November 18th, at the Hotel Great Central, London. This event is the occasion of the yearly re-union of motorists from all parts of the kingdom, and members are asked to reserve the date.

Germany's Foreign Trade in Motor Cycles.

Compared with the first eight months of 1907, German foreign trade in motor cycles for a like period during the current year shows a decline in both sales and purchases. She imported 251 machines valued at £7,530, as against 292 worth £8,760. Some sixty-five per cent. came from Belgium and Austro-Hungary. Half of the tonnage was admitted under a duty of £1 18s. 2d. a

diminished over fifty per cent., Denmark taking 212 cwts. compared with 450 cwts. in 1907.

Dry Batteries in the T.T. Race.

R. M. Brice was the only rider in the T.T. Race to use dry battery ignition on his machine. Last week we stated that he used accumulator ignition, but such was not the case, as he employed two Hellenes dry batteries in connection with a two-way switch, a plain coil, and make and break contact breaker. How well this ignition served him is proved by his average speed of 33½ miles per hour throughout the race.

A Pioneer Motor Cyclist.

Motor cyclists who remember Ernest Arnott as a former captain and one of the founders of the M.C.C. will be interested to learn that he is now a prosperous business man in British Columbia in the lumber trade. Arnott did an immense amount of pioneering work in the early days, being, we believe, the second motor cyclist to set up an End-to-end record under almost insuperable difficulties, the machine he rode being a very different specimen from the almost perfect models of to-day, and, but for his happy disposition, it is doubtful if he would have got through, his machine jibbing at most of the tussles up the steep hills on the End-to-end route. Arnott was also a noted track rider, and competed in a number of Continental road races. After being engaged in the motor car trade for some years he decided to go abroad, and has settled down in the far North-west of Canada.

FUTURE EVENTS.

- Oct. 10—Auto Cycle Union Council Meeting at Leamington Spa.
- " 17—AUTO CYCLE UNION QUARTERLY TRIAL of Motor Cycles, Uxbridge to Banbury and back.
- " 21—Motor Union General Committee Meeting.
- Nov. 13 21—Olympia Automobile Exhibition.
- " 18—Motor Union General Committee Meeting.
- " 20-28—THIRTY-SECOND ANNUAL STANLEY SHOW, at the Agricultural Hall, Islington.
- " 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.
- Dec. 16—Motor Union General Committee Meeting.

cwt., one-seventh under a rate of £1 15s. 7d., and the rest under one of £2 10s. 10d. During August the number of imported machines was twenty-one. Exports show a much larger drop, viz., 1,279 against 1,950, or a difference of 671. As this means a difference of 508 double cwts., the fall in value, based on 750 marks per double cwt., was 381,000 marks, or £19,500. Great Britain heads the list of pur-

One of the competitors in the A.C.U. Penalty Run on a Rex Lifette on Saturday last being chased by the inevitable dog.

chasers with 668 cwts. From January to August, 1907, her purchases reached 674 cwts., so that Germany has practically lost no ground in the British market. The falling off of sales in Holland is striking—66 cwts. against 656 cwts. The Danish sales, too,

A Mysterious Incident.

In the table of results of the T.T. Race we stated that J. Marshall's machine had the seal wire broken. This was found to be the case a little time after the race was concluded, but we understand that Mr. Cove, to whom the machine was handed on the winner finishing, said that the seal was intact when he took the machine over.

Irish Hill-climb.

Cecil A. Rea (3½ h.p. Triumph) won the private owners' class in the M.C.U.I. (Ulster centre) hill-climb at Central Avenue, Bangor, Co. Down, on Saturday last, A. F. Craig (2¾ h.p. X) winning the event open to all members. There were eleven competitors in the first class and twelve in the second, and the competition was witnessed by a large crowd of interested spectators.

Reliability Run for the Academic Prize.

The Berlin branch of the Motor Cyclists' Association organised on September 27th a reliability run of 210 kilometres, including a speed trial over 16.8 kilometres (10½ miles) for the Academic Prize (presented by Dr. Ernst Andreas), together with a gold medal. Out of some thirty entrants on light cars, tricars, and motor bicycles, Von Grabla's twin Phänomen bicycle showed the best results, both as regards reliability according to a river formula and the speed test.

The Brooklands Motor Cycle Handicap.

GREAT were the rejoicings at Brooklands on Saturday at the revival of the motor cycle races. The spectators really enjoyed them, and showed the greatest possible enthusiasm. Out of twenty-eight entries every one turned up at the start. Unfortunately, the start took place at the end of the finishing straight almost completely out of view; at least so far off was it from the paddock that the men were practically indistinguishable. Once under way it was merely a matter of conjecture as to who was who, and thanks to the design of the track, which only allows the competitors to pass the grand stand at the finish, the progress of the race could not be followed. Despite this disadvantage, there is no doubt that Brooklands, on

Gordon Gibson (3½ h.p. Triumph), winner of the Brooklands Motor Cycle Handicap Plate on Saturday last. Distance about 5½ miles. Handicap start 2 mins. 20 secs. Speed 53 miles per hour.

account of its absolute safety, is the place for motor cycle racing, and there is talk of a meeting being held in the very near future at which motor cycle races only will figure on the programme, and we sincerely hope that there is a strong foundation for this very pleasant rumour. At 4.10 p.m. on Saturday the Motor Cycle Handicap Plate of twenty-five sovereigns was run (the entrant of the winner received fifteen sovereigns, the entrant of the second seven sovereigns, and the entrant of the third three sovereigns); distance about five and a half miles. The winner of the event was Gordon Gibson (3½ h.p. Triumph, 84 × 86 mm.), handicap 2m. 20s., time 6m. 0½s., speed 53 miles an hour; second came R. O. Clark (5 h.p. four-cylinder F.N., 50 × 57 mm.), handicap 2m. 20s.; third, R. J. Bell (2¾ h.p. N.S.U., 75 × 75 mm.), handicap 2m. 15s., time 6m. 5½s.; fourth, W. Gené (5 h.p. twin Minerva, 70 × 75 mm.),

handicap 1m. 40s. The first four finished fairly close together. Then came in their order of finishing H. G. Partridge (6 h.p. twin N.S.U., 75 × 90 mm.), 1m. 30s. start; C. E. Bennett (5 h.p. Vindec twin, 75 × 76 mm.), 1m. 35s. start; W. H. Bashall (3½ h.p. Triumph, 84 × 86 mm.), 1m. 35s. start; H. V. Colver (3½ h.p. Matchless, 85 × 76 mm.), 1m. 40s. start. The following big machines started from scratch and had no chance at all of being placed: W. E. Cook (7 h.p. twin N.L.G., 80 × 98 mm.), M. Geiger (8 h.p. twin N.S.U., 80 × 100 mm.), W. B. R. Moorhouse (7 h.p. J.A.P. twin, 85 × 90 mm.), and C. R. Collier (7 h.p. twin Matchless, 85 × 85 mm.) Much discontent was expressed at the handicap, and as an example of this we may point out that Bell's 2¾ h.p. N.S.U. had 5s. less start than Gibson's 3½ h.p. Triumph. While it was distinctly pleasing to see three medium powered touring motor bicycles take the first three

The Brooklands Motor Cycle Handicap Plate. Scene in the paddock on Saturday last. The greatest interest was displayed in this event, 28 entries were received.

places, we should have liked to have seen the more powerful machines have at least a sporting chance. The betting was 3 to 1 against Clark and Shanks (2¾ h.p. Chater-Lea), 4 to 1 against Gibson, and 5 to 1 against the others. The complete list of starters was given in our last issue.

In our table of results of the T.T. Race, H. Reed, the winner of the twin class, was said to have 2½ ozs. of petrol left. This should have read 23½ ozs.

A group of competitors who took part in the Liverpool M.C. Petrol Consumption Trial on Saturday last, photographed outside the Abbey Hotel, Broad Green. The first motor cycle competitor was Mr. Thompson, 7-9 Waverley-Jap and side-car.

The Auto Cycle Union Penalty Run.

THIS event, always one of the most interesting features of the Auto Cycle Union's programme, was held on Saturday last over the same route as previous years, starting from the Castle Hotel, Woodford, Essex, to the 44th milestone on the Newmarket Road, *via* Epping, Harlow, Sawbridge-worth, and Newport, and back again to Woodford—a total distance of seventy-two miles, the minimum time allowed being 1h. 52m. 30s. for the half distance and 3h. 45m. for the full distance, the maximum being 4h. The conditions of the run were that any competitor making a stop of any kind was fined 1s. for each stoppage, the maximum fines incurred by any one competitor being limited to 5s., whilst any competitor failing to finish within maximum time was

The A.C.U. Penalty Run on Saturday last. Competitors preparing for the ride in the hotel yard at Woodford.

fined 1s., those failing to finish within 4½h., 2s. 6d. Pedalling, except for traffic, counted as a stop, and had to be paid for as such. Those competitors who accomplished a non-stop performance and adhered strictly to schedule times were entitled to a medal. In addition to these awards the committee of the Union offered a special prize of two guineas to the club whose representatives as a team accomplished the best non-stop performances and adhered most strictly to the minimum schedule times. For this prize the following clubs sent teams: Walthamstow, Essex, North West London, and West Essex.

Owing to the necessity for lighting up earlier at this time of the year, the start was fixed for two o'clock to enable competitors to get back before dark. Long before the time for starting the scene outside the Castle Hotel was an animated one, the competitors and their machines being watched with great interest by the large number of people who had assembled to see the start. Promptly at two o'clock the first batch of six riders were sent off, other batches following at intervals of one minute, forty-seven out of the fifty-three entrants being despatched.

The outward journey was without special interest, except for the fact that several of the competitors had to pay a shilling because they had punctured. At the turning point some of the riders showed a tendency to loiter about, but, as this was against the rules, and they were threatened with a fine of 1s., they promptly resumed their journey. The return journey was much

more irksome than the outward half, particularly between Epping and Woodford, the road between these points being crowded with outward bound cyclists. The first batch of riders were due back at 5.45 p.m., but long before this a crowd of people had assembled and were watching intently down the road for a sign of the first arrivals. Presently a group of motor cyclists was seen coming from the direction of Epping, and, although very dusty, it was soon evident that they were competitors, and a cheer was given them. Others followed at varying intervals. The following is a record of the performances:

WALTHAMSTOW M.C.—J. D. Lacey (2¾ h.p. Laurin and Klement), 3h. 56m. (one stop); *W. S. Lowe (3½ h.p. Rex), 3h. 49m. 31½s. (non-stop); H. C. Samuel (5 h.p. Vindec Special), 3h. 49m. 19s. (one stop); *O. C. Godfrey (3½ h.p. Rex), 3h. 48m. 31s. (one stop); *F. Applebee, jun. (5 h.p. Rex), 3h. 46m. 51½s. (non-stop); *W. H. Applebee (3½ h.p. Rex), 3h. 47m. 22½s. (one stop); *J. W. Percival (6 h.p. Royal tricar), 3h. 48m. 22½s. (non-stop); *R. J. Lises (5½ h.p. Humber tricar), 3h. 48m. 22½s. (non-stop); C. W. Lee (3½ h.p. Rex forecar), 3h. 47m. 22½s. (non-stop); L. Beckess (5 h.p. Kerry tricar), outside time; A. Harris (5½ h.p. Zedel tricar), 3h. 47m. 48s. (non-stop).

ESSEX M.C.—A. G. Peppercorn (2¾ h.p. A.G.P.), 3h. 47m. 55s. (one stop); B. Siffken (3½ h.p. Rex and sidecar), outside time; *A. G. Reynolds (5 h.p. Vindec Special), 3h. 46m. 47½s. (non-stop); E. C. Reynolds (3½ h.p. Quadrant), 3h. 44m. 56s. (non-stop); T. M. Tyson (3½ h.p. Rex), 3h. 48m. 22½s. (one stop); *F. W. Applebee (3½ h.p. Rex), 3h. 48m. 33½s. (one stop); *H. C. Surridge (3½ h.p. Rex), 3h. 46m. 40s. (one stop); *R. M. White (2½ h.p. Buchet), 3h. 47m. (one stop); W. H. Bishop (3½ h.p. Vindec Special), 3h. 49m. 43s. (one stop); *G. L. Fletcher (2 h.p. Moto-Rêve), 3h. 47m. 8½s. (non-stop); A. P. Howard (6 h.p. Singer tricar), 3h. 59m. 54s. (one stop).

WEST ESSEX A.C.—*V. Baldwin (3½ h.p. Brown), 3h. 51m. 11½s. (non-stop); *W. M. Gunnett (3 h.p. Triumph), 3h. 48m. 49½s. (non-stop); *W. E. Gunnett (3½ h.p. Triumph), 3h. 48m. 18½s. (non-stop); *R. C. Dendy (3½ h.p. Brown), 3h. 49m. 42s. (non-stop); *A. E. Dendy (3 h.p. Centaur), 3h. 49m. 32s. (non-stop); G. Holland (3½ h.p. Brown), 3h. 50m. 36s. (non-stop); F. A. Hardy (2 h.p. Moto-Rêve), 3h. 49m. 43s. (non-stop).

NORTH-WEST LONDON M.C.C.—*A. W. Hunt (2¾ h.p. Chater Lea), 3h. 50m. 40s. (non-stop); *H. V. Davidson, jun. (3½ h.p. Zenette), 3h. 50m. 39s. (non-stop); *C. H. Crole Rees (6 h.p. Advance), 3h. 48m. 11½s. (non-stop); *G. J. Davis (5 h.p. Vindec Special), 3h. 48m. 45s. (non-stop); *G. Rowden (3½ h.p. Bat), 3h. 44m. 10s. (two stops); *W. A. Jacobs (3½ h.p. Rex), 3h. 48m. 11½s. (non-stop); R. Scott (5 h.p. Vindec Special), 3h. 49m. 10s. (non-stop).

AUTO CYCLE UNION.—A. D. E. Craig (5 h.p. F.N.), 3h. 50m. 31½s. (non-stop); W. F. Merritt (3½ h.p. Triumph), 3h. 50m. 45s. (non-stop); H. O. Hagan (5 h.p. Vindec Special and sidecar), outside time; R. H. Ratcliffe (3½ h.p. Triumph), outside time.

MOTOR CYCLING CLUB.—C. H. Barfield (5 h.p. Vindec Special), 3h. 51m. 11½s. (non-stop); W. Smith (2 h.p. Moto-Rêve), 3h. 49m. 31½s. (non-stop); C. C. Cook (3½ h.p. Triumph), 3h. 49m. 33½s. (non-stop).

GREAT YARMOUTH AND DISTRICT M.C.C.—F. W. Barnes (3½ h.p. Zenette), 3h. 50m. 31½s. (non-stop); F. G. Galley (2¾ h.p. Anglian), 3h. 45m. 33½s. (non-stop).

BOCARDO M.C.C. (Oxford).—H. G. Hill (5 h.p. Vindec Special), 3h. 48m. 51s. (non-stop).

*Riders nominated to compete for the team prize.

The West Essex A.C. proved winners of the team prize, all six riders making a complete non-stop performance. The following were the officials: Judges, Messrs. B. Chatterton and H. G. Cove; timekeepers, Messrs. Burley, Straight, and Wakefield; marshals, Messrs. M. W. Randle, H. B. Renner, C. Glenny, and O. L. Summers. Mr. Glenny kindly conveyed the timekeeper to the turning point on his car.

CLUB NEWS.

Lincolnshire M.C.C.

The last meet of the year is at Skegness, at the Pier Hotel, on Saturday, at 3 p.m. Tea at 5. The team trial is next Wednesday, and the London run on the 24th.

Western District M.C. (London).

The above club will hold a petrol consumption test on the 11th inst. at Gerrard's Cross. Meet at the Milford Hotel 9.30 a.m. Entrance fee, 2s. 6d.

The hill-climb held last month has been declared void owing to some inaccuracies in the weighing of competitors' machines, and will be held at a future date to be announced shortly.

Coventry M.C.

The above club held a speed judging contest on Saturday last in the Warwickshire lanes. No competitor was aware of the course, and no watches or speed recorders were permitted. A six-cylinder Humber car, driven by Mr. S. Wright, and kindly lent by Humber, Ltd., laid an ingenious paper trail over a devious route which included Finham Green, Baginton, Stoneleigh Hill, Ashow, Cubbington, Weston, Princethorpe, Marton, and Long Itchington. Twenty-five miles were recorded on the distance indicator when the Humber car was brought to a standstill at Long Itchington. Thirteen motor cycles and cars took part, and were allotted various speeds ranging between fifteen and twenty miles per hour. The prize for best performance on a motor cycle was awarded to Mr. E. J. Hardy (Hardy tricar), 18 m.p.h., who was only 40s. too fast. Other motor cyclists were T. W. Drayton, $3\frac{1}{2}$ h.p. Triumph, error 18m. fast; H. M. Carter, $3\frac{1}{2}$ h.p. W. and P., 12m. 55s. fast; A. Startin, 5 h.p. Riley tricar, 5m. 8s. slow; E. W. Harris, 3 h.p. Triumph, 5m. 35s. slow; and C. T. Lloyd, 5 h.p. Rexette tricar, 7m. 35s. fast.

Liverpool M.C.

On Saturday last, October 3rd, the above club held its annual petrol consumption trial, starting at Broad Green (outside Liverpool). The weather for once being very favourable a very fair number of entries were received. All competitors were weighed on the spot, tanks and carburettors emptied, and petrol given out equivalent to one gallon for every 300 lbs. total weight. The course was ten miles long. All tanks were officially sealed. Competitors, if they had completed the course and had any petrol left, continued until the petrol gave out, when they remained at the same spot till picked up by the official car, when the distance travelled was checked and the tank seals examined. Speed was not to exceed twenty miles per hour, and no pushing or pedalling was allowed. Two prizes were given first value £1 and all entrance fees; second value £1. Results:

No.	Rider and machine.	Miles.	Miles per gallon.
1.	Mr. Philpott (6 h.p. Wolseley) ...	27	= 44 $\frac{1}{2}$
2.	Mr. Thompson (7-9 h.p. Waverley-J.A.P. and sidecar) ...	24 $\frac{1}{2}$	= 109 $\frac{1}{2}$
3.	Mr. Lee (6 h.p. Waverley-J.A.P. and sidecar) ...	23 $\frac{1}{2}$	= 112 $\frac{1}{4}$
4.	Mr. Lake (10-12 h.p. Humber car) ...	23	= 24 $\frac{1}{2}$
5.	Mr. Jones ($3\frac{1}{2}$ h.p. Rex and sidecar) ...	22 $\frac{3}{4}$	= 112

Nine motor bicycles, one tricycle, nine motor bicycles and sidecars, and three cars took part in the contest.

Manchester M.C.

To mark the closing run and the last competition of the year the above club held its second petrol consumption competition over a circular course of about twenty-five miles on Saturday last. It was open to both motor cycle and car members, and there were two prizes offered in each class eliciting an entry of twenty-six. Petrol was served out by the club (Shell spirit), according to weight and horsepower, none of the motor cycles receiving a quantity much exceeding a pint, yet several competitors almost completed the entire circuit of twenty-five miles on that amount. Some of the cars did marvellous performances by doing about a circuit and a half. The results on handicap of the motor cycle class were as follows: 1, J. L. Rose, $4\frac{1}{2}$ h.p. four-cylinder F.N., equal to 132 miles per gallon; 2, J. E. Tytler, $3\frac{1}{2}$ h.p. Triumph, 192 miles per gallon (a club record); 3, Otto Gross, $4\frac{1}{2}$ h.p. Eagle Rurabout, 80 miles per gallon; 4, A. J. Moorhouse (hon. sec.), 5 h.p. twin Rex, 131 miles per gallon. The others were out of it owing to various faults and minor

mishaps. It was quite dark by the time the official car had checked the results, which were announced at the Nags Head, Bucklow Hill, ten miles from Manchester. Special auxiliary tanks capable of being emptied to the last drop were supplied by the club.

Birmingham M.C.C.

A "flexibility" hill-climbing competition was held on Saturday on Weatheroak Hill, near Alvechurch. There were thirteen entries, and everything passed off successfully, a goodly concourse of the members being present as spectators. The competition consisted of a fast and a slow climb up the hill, which is about a quarter of a mile long and has an average gradient of about 1 in 6. A prize was awarded for fastest time, another for slowest time, and a third prize for the competitor having the greatest difference between his fast and slow times. All three prizes were carried off by H. Rem Fowler on his T.T. twin Norton. Results as follows:

Competitor and Machine.	Time in seconds.	
	Fast.	Slow.
1. Rem Fowler (5 h.p. Norton) ...	27s.	63s.
2. R. Pritchard (6 h.p. N.S.U.) ...	27 $\frac{2}{5}$ s.	62 $\frac{3}{5}$ s.
3. R. W. Duke ($3\frac{1}{2}$ h.p. Triumph) ...	32 $\frac{2}{5}$ s.	53 $\frac{3}{5}$ s.
4. L. J. Walker ($3\frac{1}{2}$ h.p. Triumph) ...	37 $\frac{4}{5}$ s.	55 $\frac{3}{5}$ s.
5. E. C. F. Evans (6 h.p. Rex) ...	35s.	50 $\frac{1}{5}$ s.
6. H. C. Rapier (5 h.p. N.S.U.) ...	37 $\frac{1}{5}$ s.	52 $\frac{1}{5}$ s.
7. Seymour Smith (5 h.p. Norton) ...	31 $\frac{4}{5}$ s.	43 $\frac{1}{5}$ s.
8. J. Troman ($3\frac{1}{2}$ h.p. Triumph) ...	33 $\frac{3}{5}$ s.	44 $\frac{2}{5}$ s.
9. F. G. Sandison ($3\frac{1}{2}$ h.p. Triumph) ...	32 $\frac{2}{5}$ s.	43 $\frac{3}{5}$ s.
H. J. Heaven ($3\frac{1}{2}$ h.p. Quadrant) ...	39 $\frac{2}{5}$ s.	Failed
J. C. Norton ($3\frac{1}{2}$ h.p. Norton) ...	36 $\frac{1}{5}$ s.	Failed
H. Oswald ($3\frac{1}{2}$ h.p. Quadrant) ...	Failed.	
R. Samson ($3\frac{1}{2}$ h.p. L.M.C.) ...	42 $\frac{2}{5}$ s.	Failed

The result of the petrol consumption trials held on September 5th has been withheld in order to check the figures obtained. As these appeared so remarkable in one or two

Start of some of the competitors in the Brooklands Motor Cycle Handicap Plate, as seen from the banking, looking up the finishing straight.

instances the leading figures were rechecked to ensure accuracy. The results were almost identical with those previously obtained with one exception, and are given herewith. The course was a circular one of twenty-six miles, and was covered twice. A speed of twenty miles per hour was fixed, to which all competitors conformed:

Name and machine.	Petrol consumption.	Miles per gallon.	Order on formula.
R. Samson ($3\frac{1}{2}$ h.p. L.M.C.) ...	2.5	160	1
F. G. Sandison ($3\frac{1}{2}$ h.p. Triumph) ...	3.56	112	5
R. H. Edwards ($3\frac{1}{2}$ h.p. Triumph) ...	3.87	103	7
R. W. Duke ($3\frac{1}{2}$ h.p. Triumph) ...	3.18	126	3
H. Oswald ($3\frac{1}{2}$ h.p. Quadrant) ...	3.56	112	6
Rem Fowler (5 h.p. Norton) ...	4.31	92.6	8
H. Heaven ($3\frac{1}{2}$ h.p. Quadrant) ...	6.5	61.5	10
H. C. Rapier (5 h.p. N.S.U.) ...	4.5	88.5	9
J. Troman ($3\frac{1}{2}$ h.p. Triumph) ...	3.25	123	4
A. M. Lomax ($3\frac{1}{2}$ h.p. Triumph) ...	2.75	145.5	2
J. Whitworth ($1\frac{1}{2}$ h.p. Werner) ...	6	66.5	11

ab News.—

Bocardo M.C.C. (Oxford).

At the end of last month a hill-climb and speed-judging contest took place, with the following results:

Hill-climb (Prof. Callendar's formula).—1, R. G. T. Gillman (3½ h.p. Fafnir), figure of merit 56.17. H. Braithwaite made a good second on a 3½ h.p. Triumph, figure of merit 56.62.

Speed-judging.—The object was to ride one-fourth of a mile at an average rate of 15 m.p.h. This event was won by Mr. Pilcher, his time being 1m. 2s.

Birmingham M.C.C.

On the 10th inst. the run is to Leamington, starting at 2.30 p.m. On the Monday following, members will join in a run to Stratford, starting from College Road at 6.30 p.m. October 17th, run to King's Bromley; 24th inst., Atherstone; and 31st inst., Harvington Hall.

Pembrokeshire A.C. (Motor Cycle Section).

On the 25th ult. a very successful hill-climbing competition was held for club members. The club gave three medals in the motor cycle class—(1) best performance single-cylinder machines on formula, (2) fastest motor cycle, and (3) best performance multi-cylinder machine on formula. The results were:

SINGLE-CYLINDERS.

	Order on Time.	Order on Formula.
E. Allen, 3½ h.p. T.T. Triumph	... 1 ...	1
G. F. Owen, 3½ h.p. Triumph	... 2 ...	2
Eric Green, 3½ h.p. Triumph	... 3 ...	3
L. H. Higgon, 3½ h.p. Triumph	... 5 ...	4
A. J. Gwilliam, 3½ h.p. Rex	... 4 ...	5
G. A. Hill, 3 h.p. Triumph	... 8 ...	6
Hugh James, 3½ h.p. Triumph	... 6 ...	7

D. Evans, 3½ h.p. Vindec	... 10 ...	11

TWIN-CYLINDERS.

Ralph Green, 5 h.p. Vindec	... 1 ...	1
----------------------------	-----------	---

The prize for the fastest time of the day was won by Mr. E. Allen. The committee also subscribed for a special medal to be awarded to Mr. G. F. Owen for best performance of a private owner on his own machine.

Meet of the Oxford Bocardo M.C.C., on the occasion of the last competition during 1908.

The hon. sec., Mr. J. B. Gaskell, Clyst House, Milford, Haven, will be pleased to enrol new members.

Bradford M.C.C.

The following are the donors to the "Subscription Trophy" for the open hill-climb, and the Bradford club wishes to express its sincerest thanks to the subscribers: The Michelin Tyre Co., pair of tyres value £6; the Jowett Motor Co., £1 1s.; Mr. J. A. Prestwich, £1 1s.; the Triumph Cycle Co., Ltd., £1 1s.; the Rex Motor Mfg. Co., Ltd., £1 1s.; E. M. Bowden's Patent Syndicate, Ltd., £1 1s.; Mr. E. S. Myers, 10s. 6d.; J. Lucas, Ltd., an Acetylene lamp value 17s. 6d.; the Hanover Rubber Co., 10s. 6d.; Brown Bros., Ltd., 10s.; J. B. Brooks, Ltd., 10s. 6d. As announced in another part of this issue, the open hill-climb arranged for the 3rd inst. has been abandoned, but a similar event will probably be held next year.

Capt. Sir R. K. Arbuthnot, Bart., R.N., after finishing third in the Tourist Trophy Race in the Isle of Man. His average speed was 38.2 miles per hour and consumption 107.2 miles per gallon. The third prize was £10, and Capt. Arbuthnot also wins Mr. M. J. Schulte's silver cup for the fastest time by a private owner on a single-cylinder machine.

"THE AUTOCAR" LECTURES.

Arrangements have now been completed for a series of eight lectures referred to in previous issues), to be given at the following centres: Newcastle-on-Tyne—Armstrong College, Monday evenings at 7.30, commencing October 26th. London—Queen's Hall, Langham Place, Tuesday afternoons at 3.30 and evenings at 8.30, commencing October 13th. Birmingham—The University, Edmund Street, Wednesday evenings at 7.30, commencing October 21st. Leeds—The University, Thursday evenings at 7.30, commencing October 22nd. Manchester—Geographical Institute, Parsonage, Deansgate, Friday afternoons at 4 and evenings at 7.30, commencing October 23rd. The lecturers are Dr. W. R. Ormandy (Tate Research and Bishop Berkeley Fellow of the Owens College, Manchester) and Mr. J. H. Lester, M.Sc. (of the Manchester Chamber of Commerce Testing House). These lectures will be quite as interesting to motor cyclists as to motor car owners; we therefore advise our readers in the districts above mentioned to write for further particulars to the Secretary, Lecture Department, *The Autocar*, 20, Tudor Street, E.C. The fee for the course is £1 1s.

Letters to the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 23, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The Standardisation of Motor Cycle Rims.

[3581].—I have noticed of late several letters upon the above subject, and, as a manufacturer of motor cycle tyre rims, I beg to state that all English 26in. x 2in. tyres will fit one standard rim, but the 26in. x 2½in. and 26in. x 2½in. vary in different makes. I think the best thing to do when ordering rims is to state what size and make of tyre they are required to fit.

J. T. JAMES.

A Puncture Curing Material.

[3582].—I don't think many of your readers know of Allustite, a liquid preparation for putting inside air tubes to repair punctures. I put some inside mine nearly four months ago, and have never had to blow them up since. The front tyre was punctured when I put it in, and I have pulled out one nail from the back tyre and have not touched it since. I think if End-to-end riders were to use it they would not have any punctures to mend, and so save time and marks. I know I would not be without it now. It was introduced to me by Mr. Michael Bruce, 60, Clerk Street, Edinburgh, when I was getting a belt for my motor cycle. I had only met Mr. Bruce twice before, so this is not a case of a free advertisement, but I believe in "honour where honour is due."

S 1116.

Footrests v. Pedals and Stands.

[3583].—In reply to "A. Hodgson" [3556], I am the proud owner of a 5-7 h.p. twin Roc which I have christened "the no trouble machine." I bought the machine second-hand, and since it has been in my possession have been several hundreds of miles on it with passenger (ten stones)—myself eleven stones—through six or seven different counties, but have never had the least suspicion of a slipping clutch. During this time I have never cleaned or rinsed the clutch with petrol or anything else. I ride my machine in all weathers, and if Mr. Hodgson happens to be passing this way (Farnham, Surrey), he will meet one very satisfied rider of the Roc.

S. A. PARSONS.

[3584].—We think that your correspondent "Medico" cannot have seen your report of our traffic ride through the city (observed by yourselves) in your issue of September 2nd.

Our Gradua gear overcomes all the difficulties which he finds with his present mount. The engine can be started with a handle direct on to the engine, with the machine lying over on its footrests. There is no need to hold up either the machine or the exhaust valve whilst doing this.

The gear being infinitely variable, the engine is never raced in traffic, and that the engine can be kept cool in traffic is amply proved by our demonstration as referred to above.

ZENITH MOTORS, LTD.

[3585].—I am much interested in the discussion of Roc clutch and two-speed gear. I have a 1908 Roc machine, and find that on level roads the high gear band grips fairly well, even when splashed with oil. The low gear band will not grip properly on steep hills. The machine comes to a standstill, and the engine continues to race.

My weight is over seventeen stones, and that may have something to do with it. I met an enthusiastic rider at

Abington, Lanarkshire, this summer who had the same difficulty, and found a perfect cure by drilling a hole somewhere in the lever near the clutch and giving it more power that way. Unfortunately, I forget the exact position. If this should meet his eye, or if any other rider could suggest a cure, they would lay myself and other users of the Roc under a deep obligation. Meantime, it is a case of pushing when the hill is at all steep. The high gear is 4½ to 1.

ENQUIRER (Glasgow).

[3586].—At the risk of repetition, may I again state that should the Roc clutch slip the remedy lies in the adjustment provided for the purpose? I am afraid some of your correspondents have resorted to an unwarrantable attack upon the Roc clutch and hand-starting device instead of keeping to the subject, viz., the safety and convenience of footrests *versus* pedals and stands, therefore the subject should be confined to the question as to which system the motor cycle is better equipped with from a safe, comfortable, and general utility standpoint. As the Roc clutch plays a very important part in the footrest system, and its utility has been attacked, in order to allay any misgiving on this point, I am prepared to invite your correspondents to consign their machines at my expense to any hill in the Midland district. I will then and there examine the machine; should it be in reasonable running order, and provided the gear and clutch has not met with any undue wear and tear, neglect, or misuse, I will demonstrate the absence of any slipping, including the facility for stopping and starting on any portion of the hill, and to do anything it is reasonably expected of a modern motor bicycle appertaining to the clutch and two-speed gear with hand-starting device.

Most of your readers will agree this would be a fair and searching test, and I make this suggestion solely to be enabled to successfully repudiate any misrepresentations which, if left unchallenged, might do serious harm to a system where comfort and safety are the first consideration.

ARTHUR W. WALL.

[3587].—Your correspondent Mr. Hodgson evidently seems to have a grievance about his clutch slipping on hills; of course it will if he oils it injudiciously. Does anyone ever hear of a car owner oiling his metal to metal brakes? [Yes.—Ed.] I am the proud owner of a 5 h.p. Rex de Luxe with a clutch only. I never oil it (perhaps I am wrong), and I have slipped it purposely on Edge Hill (when I was trying to get up with a sidecar with a 4 to 1 gear) till the enamel was burnt off the hub, and it did not injure the clutch in the least. The clutch was the much-abused Roc clutch. I have only had it slip on one occasion, that was when the expanding arms got past the dead centre, and then it was only a few minutes' work to put a washer under the joint which holds the fixed end of the arm, and the clutch was as good as new. Starting up is extremely easy if plenty of petrol is injected and the plug points are quite close together. A good clutch is invaluable with a sidecar. Talking of clutches that slip when they ought not to reminds me of a triear which came to the works, where I am, to be overhauled. It had—a clutch (?) We put it on the stand and started it up and pushed the lever out which actuated the clutch, and then applied the Bowden brake on the back wheel, but it did not stop it, so we got a file and fairly levered up that shoe. It stopped the wheel, but the engine

was labouring horribly and sparks were flying from the pulley (where the clutch was), so this was evidently only an "emergency" clutch. I may say that my machine will beat a lot of machines round here (Coventry) of higher horsepower, both for speed and reliability. I may add that I have no interest in the welfare of either the Rex or the Roc clutch, and that when I see a letter like Mr. Hodgson's I feel it my duty to write.

JOHN F. CRAGG.

[The original Roc clutch with expanding arms is referred to in this letter.—ED.]

Cylinder Deposits.

[3588.]—I have made analysis of two "cylinder deposits" as follows:

	1906		1908
	3 h.p. N.S.U.		Triumph.
Carbonaceous matter	... 59.0%	...	53.0%
Road dust	... 19.5%	...	37.0%
Metallic iron	... 21.0%	...	10.0%
Metallic copper5%	...	Not examined for
	100.0%	...	100.0%

Colour of deposit as received ... Dull black Oily black
Colour of deposit after calcination ... Dark red Light red

The N.S.U. machine had run several thousand miles. The copper in the deposit, I think, could only be accounted for by the lubricating oil containing free acid, either originally, or by becoming rancid. The oil used is a well-known brand.

The Triumph had only run about 1,000 miles. It is very interesting the large amount of dust found in the deposit. The percentages of iron given in the analyses are other than those found in the road dust.

BB 245.

Sidecars, Tyres, and Belts.

[3589.]—Replying to "H4220" in *The Motor Cycle*, re sidecar, tyres, and belt. I ride the same make of machine as mentioned, viz., a Vindec, but fitted with two-speed gear and 2½ in. Palmer cord tyres. I use Montgomery sidecar, with flexible joints, and I have already done over 1,000 miles on the machine, and the rear tyre is good yet for many hundreds of miles. Re the belt, I had much the same trouble until I got a Whittle link belt, and my trouble ceased with this. Re flexible joints on sidecar, I find it a little difficult steering in thick traffic owing to the swinging of the joint, but once out on open roads it is quite comfortable. I think that if "H4220" will obtain this combination his trouble will end also, as he will certainly not have to carry any spare tyres or belts, and with the machine he rides I know from experience he need fear no trouble, as my whole combination throughout is perfection.

G. E. TENNANT.

Abnormal Petrol Consumption.

[3590.]—I have read with interest "End-to-end Impressions," by Mr. B. H. Davies, in *The Motor Cycle* of July 29th, and was particularly interested with the account of Mr. Dixon's troubles with his 3½ h.p. Vindec.

I also have a similar machine, and it suffers from the same trouble. The petrol used (not solely by the engine, but ejected through air holes of jet chamber) is very excessive. The carburetter is an F.N.

I have tried altering the amount of lift of a.o.i.v., also different strength of springs on same, but have met with no better success. I have written to the agents with reference to abnormal consumption, but up to the present have not had a satisfactory explanation. Judging by the appearance of the throttle, etc., there appears to be back-pressure, as the one side of the throttle is quite discoloured. By the way the petrol is ejected there is every indication of back-pressure, as when the spark is cut out and engine running with exhaust valve working as usual—the engine running, of course, by momentum—the petrol is not expelled.

I have seen the same thing as I have stated occur with another 3½ h.p. Vindec fitted with F.N. carburetter, but this has been partly overcome by fitting an extra adjustable air-sleeve on induction pipe.

As my petrol consumption is so excessive I intend fitting a B. and B. carburetter, and hope that this will reduce my petrol bill.

I should be greatly obliged if any of your readers could give me a satisfactory explanation of the matter, as I have now, after numerous experiments, to admit myself beaten.

East London, S.A.

SNOMYSIGH.

Two-stroke Engines and Formulæ in Hill-climbs.

[3591.]—In regard to the propositions in Prof. Callendar's letter, it will be obvious to all motor cyclists that a proper basis of efficiency must take account of the mechanical as well as the thermal losses in the engine.

It is evident that Prof. Callendar, in making the statement that "judged merely on a basis of efficiency the two-stroke cycle is undoubtedly inferior to the four-stroke," shows a complete disregard of the mechanical inefficiency of the Otto cycle as compared with the two-stroke cycle. Quite apart from the power lost in lifting valves against strong springs, and cylinder pressure, the amount of power absorbed at high speeds, by the piston ring friction during the exhaust and suction strokes of the four-cycle engine, is more than sufficient to set off against the reduced thermal efficiency in the two-stroke. Further, is it fair to double the cylinder capacity of a two-stroke for the purpose of formula computation without allowance for the ineffective portion of the stroke during exhaust and distribution? or to expect an engine with effective stroke of two inches to give twice the power of one with three-inch stroke (other dimensions being equal)?

ALFRED A. SCOTT.

Lubrication Methods.

[3592.]—With reference to "Ixion's" comments on lubrication in your issue of September 16th, we must all agree that automatic lubrication would be better than bad hand lubrication, but I expect the ideal automatic lubricator is hard to find. An air-cooled engine has such a widely varying oil consumption under different conditions, even though it may be running at the same number of revolutions per minute all the time.

The drip feed system must be controlled by hand to be efficient, unless the oil consumption is steady—which it never can be; also, air-cooled oil at temperatures below freezing point will not drip readily. Similarly, any method which supplies oil in direct ratio to the number of revolutions per minute will fail owing to the widely varying consumption of oil under different loads and varying air temperatures. The system by which the excess of oil is automatically pumped out of the crank case into a reserve tank would be better, but adds weight and complication to the engine, which is flooded with oil every time the engine is stopped and started again.

The hand pump need not be abused—as recommended by most makers. It is not difficult to learn when the engine needs oil and to give it a little at a time as required. The requirements of a 5 h.p. twin under different conditions while running may vary from one ounce of oil for forty miles up to one ounce for two and a half miles, and even more on a very hot day with low gear and full load.

I have no personal experience with car engines, but suspect, from what car drivers have told me of their oil consumption, and from the clouds of blue smoke which issue from some exhausts, that many car engines are at times enormously over-oiled.

F. C. JAMES.

Acetylene Gas Generators.

[3593.]—I was especially interested to see the letter from Mr. Ridge on the subject of "Autoclipse Generators," as I am also a sufferer from the same trouble as himself, and have not, thus far, been able to devise any satisfactory means for correcting it. Though not a Model E, my generator works on the same principle as his (all the Autoclipse models being on identical systems), and the trouble is that the water does not offer sufficient resistance to the pressure of gas generated, which, at 1 or 2 ozs. pressure, pushes its way through the water and escapes through the safety pipe provided.

When I purchased the generator from the company and experienced this trouble I returned it, explaining the facts, and they returned it to me (presumably cured) after soldering up two of the water approach holes, which had absolutely no effect. Soon after this Messrs. Brown Bros. took over the agency, but I have not approached them on the subject, as I realise that the trouble is incurable so long as the present construction is unaltered. It is useless fitting a light pressure valve in the safety pipe, as the gas, in order to be available for the lamps, must be prevented from escaping into the outer chamber. The only remedy seems to lie in this direction, but as I am unable to rise to the occasion, I should be glad to know of the experiences of your readers

with this generator, and, if they have overcome the trouble, how they managed it.

My present procedure is: (1) Never fill up with water until lighting up time, and (2) withdraw carbide reservoir from water tank immediately lamps are extinguished. The only alternative is, as Mr. Ridge finds, that of wasting all one's carbide in the course of forty-eight hours, even if one has only used the lamp for two minutes.

The bubbling noise is the frequently recurring escape of generated gas through one of the small holes into, and up through, the water, and so away through the safety pipe. For the Autoclipse lamps (motor cycle models) I have nothing but praise, and if the generator would only behave itself (Model D, voiturette size, to feed the two tricar headlights) I should be perfectly satisfied. P. H. MEERS.

Suggested Improvements.

[3594.]-The following may be of interest to readers of your valuable paper:

TYRES.-Many people seem to experience serious trouble with these. This can be avoided if nail catchers are fitted, provided the wheels are suitably shod. The best type of nail catcher is made of a $\frac{3}{8}$ in. steel rod, curved to fit tyre, clamped at each end to front (or back) forks, and set to clear tyre by $\frac{1}{8}$ in.

$2\frac{1}{4}$ in. tyres will do for a $3\frac{1}{2}$ h.p. machine, but for 5 h.p. or over a $2\frac{1}{2}$ in. front and 65 mm. voiturette rear cover are necessary.

Peter Union puncture-proof bands should be fitted to the $2\frac{1}{4}$ in. and $2\frac{1}{2}$ in. covers.

The tubes should be extra heavy, and it is advisable to solution a 2 in. strip of canvas round the inner circumference of each. This entirely prevents the edges of cover chafing and puncturing tube, which commonly happens.

If Palmer cord or Peter Union heavy tyres are used under these conditions, little or no tyre trouble will be experienced. My last rear cover ran over 3,500 miles, on a $3\frac{1}{2}$ h.p., over flinty roads, before puncturing.

ENGINES.-Is it not time that manufacturers devoted their attention, not to obtaining the utmost possible power from a given sized cylinder, but to making engines which will not lose their power or wear out rapidly? Some singles are very satisfactory, though I consider larger release valves to crank case are necessary. The modern twin engine is a long way behind the modern single. The bearings are too small, more attention should be given to the material of which valves and rings are made, and m.o.i.v. are essential; a.o.i.v. possess two great disadvantages-they are liable to get out of adjustment, and, as they are necessarily made very light, they often break.

A twin engine, about 82 mm. by 90 mm., with m.o.i.v., ball bearings to crankshaft and timing gear, really good rings and valves, and a slightly lower compression than usual, would be almost ideal, as it would develop about 5 h.p., be very flexible, and require little attention to keep in order.

FRAMES AND FORKS.-For high-powered machines these could be greatly improved.

The rear wheel should certainly be sprung, and as this presents no very great difficulty, I am surprised it is not done in all cases. During long-distance rides the difference in comfort is enormous, and the stresses on frame and engine are greatly lessened.

A spring fork should allow the wheel absolutely no side play, and should have springs or other appliances to take up the sudden rebounds. These two faults are common to very many spring forks, and greatly increase the danger of side-slip.

SPEED GEARS AND CLUTCHES.-If really satisfactory, these would greatly improve a high-powered machine. Many firms are making hub epicyclic gears, but is a single one of these really successful under all conditions? If so, why are so many makers afraid to run them in long-distance trials?

For the sake of strength, a gear of this type must be heavy, and this weight, being added to the rear wheel, slows the machine badly, so that a 5 h.p. twin with hub gear climbs little better than a good $3\frac{1}{2}$ h.p. single geared.

The lubrication of a hub gear of this type is also a difficult matter, at least on long-distance non-stop runs.

The remedy for these troubles is to abolish hub gears, and fit a three-speed (sliding, direct top) gear box, with ball bearings throughout, in front of crank case. Drive by chain from engine to gear box, and by single (or twin) belt from

box to wheel. This type of gear would require no attention except filling with oil every six hundred miles or so, and with belt drive would be quite foolproof.

Many other points like these suggest themselves to the enthusiastic motor cyclist, but, as this letter is already very long, I will not say more now.

ENTHUSIAST.

The Tricar Question.

[3595.]-I have been much interested in the letters recently appearing in *The Motor Cycle* regarding tricars, as I have always had a particular fancy for this class of vehicle. So far I have seen practically nothing as regards the merits of the open frame compared with the ordinary bicycle type of frame. Three years ago I had a 5 h.p. twin Corydon cycle fitted with a very substantial forecar attachment, which formed, practically, a tricar. This machine was very safe and comfortable to ride; it was belt-driven, and would take two up nearly all hills without assistance. Had this machine been fitted with two-speed gear, free engine, and various other modern improvements, it would have formed an ideal light tricar. This year I purchased a 5-6 h.p. water-cooled tricar of well-known and advertised make. This machine had an open frame, sprung fore and aft, multiple disc clutch, wheel steering with a very good chain arrangement connecting it to the front wheels; it had also an epicyclic two-speed gear. With all these refinements it was not so satisfactory, taking it all round, as the simpler machine previously mentioned.

The first fault which made itself evident was that the bands of the epicyclic gear were constantly requiring the most minute and careful adjustment; this I put down to the lack of rigidity in the frame. Next the chain of the steering gear was so unprotected that it caught all the dust and dirt thrown up by the front wheels, and constantly required cleaning, which was a very difficult and messy job. The chain from gear to back wheel was not nearly heavy enough for the work it had to do, and therefore was always stretching, and it broke after less than 200 miles. These defects I could have put up with had it not been for the terrible amount of swing or "whip" of the back seat. It was a fast and wonderful hill-climber, and most luxurious to ride, provided it was driven on the crown of the road; but if the road had much camber, the back portion would twist and swing over to such an extent that one felt it was going to pull the whole thing over-which indeed it did on two or three occasions. If the road were greasy, even though a studded band was fitted to back wheel, it was only with the greatest difficulty that the machine could be got back to the crown again. On one occasion the back wheel skidded down into the gutter, throwing the machine across the road into a passing tram. My wife, who was in front, and myself fortunately escaped, but the front seat was wrecked. It was only possible to ride the machine solus by exercising the greatest care, as the "whip" was so great that in rounding a corner even at very slow speed it would almost pull the machine over. This was accounted for partly by the instability of the frame, the springing of the back wheel, the distance of the wheel from the too narrow gauge front wheels, and the rather high centre of gravity of the driver's position. These troubles were non-existent with the bicycle frame variety previously referred to. The open frame is undoubtedly more comfortable and "car like," but it seems a pity if the stability of the whole machine should have to be sacrificed to such an extent to gain this end. I should be very glad to hear other readers' experiences in this matter.

TRI-AGAIN.

[A number of interesting letters are unavoidably held over. These will be published as space permits.-ED.]

Will "FY 99" kindly communicate with the Editor?

What USERS think of the 95 Guinea O.T.A.V. CAR.

From *The Autocar* 19/9/08.

QUERIES.

No. 719.—5½ h.p. Two-seater O.T.A.V.

I SHALL feel greatly obliged to have the opinions of owners (and others who have had experience) of the O.T.A.V. 5½ h.p. two-seater.—F.S.B.

From *The Autocar* 26/9/08.

REPLIES.

No. 719.—5½ h.p. Two-seater O.T.A.V.

Although I have not had an O.T.A.V. Car very long, I feel I can say a word for it. I bought one in London, and although I had no previous experience, I found no difficulty in driving it 325 miles from London to Southport. All the tuition I had was about half an hour on Hampstead Heath. The way it romps up hills is a revelation. On some of the stiffer hills we more than held our own. We averaged 20 miles an hour comfortably. Although the roads were very bad owing to the heavy rain, we came right through on top speed, and never had the slightest grunt from the engine. The part of the car that strikes me as the most wonderful is the gears. You can move the gear lever as much as you like, but never hear the slightest sound, and the makers say you cannot do it any harm. The engine does not get hot; in fact, it seems to be more than strong enough for its work, and anyone who buys a car should master it in half an hour. It is a wonderful production, and one that can be bought with every confidence. The appearance of the car belies its power and speed.—A. WATSON.

I have driven one of these voiturettes for some months, and have found it an extremely satisfactory little car. It is exceptionally flexible and handy in traffic. I have done several runs of 100 miles on it in the afternoon and evening, averaging 20 miles an hour. This was after I had had an extra air inlet fitted. I have never had the least trouble in regard to overheating at any time, though I have used it for hours at a time in heavy London traffic.—J.E.C.

I have driven one of these voiturettes for some time past, and find it most satisfactory in every way.—C. KNOWLES (Mrs.)

The Junior & O.T.A.V. Cars Co., Ltd., 117-119, Long Acre, W C

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or sent to London, by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.
Lancashire and Yorkshire.

SECTION III.
Cheshire, Flint, Denbigh, and Merioneth.

SECTION IV.
Northampton, Rutland, Lincoln, and Leicestershire.

SECTION V.
Huntingdon, Cambridgeshire, and Suffolk.

SECTION VI.

WRITE FOR LISTS.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.

Telephone: 4310. Telegrams: "Premier," B'ham

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Hiffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

Accumulators UNSPILLABLE 1908 TYPE.

Read what a private rider says (Motor Cycle, July 15th, '08, letter No. 3414) when answering a letter from another reader of the Motor Cycle, who does not use "E.P.R." accumulators.

"If your correspondent will try 'a couple of 'E.P.R.' unspillable accumulators, I think his troubles will be at an end. If he cares to do so, he can put them in his 'tank upside down, but he will get 'no acid trouble. Unlike most of 'the unspillable type, they contain 'no jelly. I have had two in use 'for some considerable time, and 'find them excellent."

No. 20c: 4 x 2½ x 6in. "Acid type," 14/6.

No. 20c /08. 4 x 2½ x 6in. "Unspillable," 17/6.

We make these unspillable accumulators in all sizes from 5 to 50 amp. capacity. All unspillable types are sent out fully charged and ready for use. No loose acid to shake out. Full instructions with every cell. All batteries, whether usual type or unspillable, fitted with "E.P.R." non-corrosive terminals.

A FEW SIZES ARE LISTED HERE.

		"Acid type."	"Unspill."

WANTED, 5 h.p. Riley Tricar, no rubbish will give 6 h.p. twin Phenomen, magneto, two speeds, sidecar to match, all in perfect condition, and cash.—Full particulars to Ashby, Horton Grange Cottage, Raymill Road, Maidenhead.

YOU KNOW THAT

The ability to drive slowly is as important as the ability to drive fast. Now **WHITE'S ECONOMISER** enables you to keep going steadily at a walking pace, without misfiring. It enables you to *throttle down to the extreme, and ensures an instant start* at all times, in all weathers, without flooding Carburettor and without opening throttle more than for normal running. It therefore *saves your petrol*, and has, in fact, *won first prize* in recent consumption test. It can be attached in half a minute to models E and H Longuemare, Rex, and Minerva-Longuemare, and /08 Triumph Carburettors. Try one—it is so simple, and its price is only 4/- each.

THE "ELECTARY" ADJUSTABLE FOCUS PROJECTOR, with GENERATOR (The finest motor cycle Searchlight extant), 30/- ORDINARY MIRROR LENS SEARCHLIGHTS, with Generator (as sold elsewhere at 30/-), 22 6

ADDRESS—20, TUDOR STREET, LONDON, E.C.

Motor Cycle Lamps.

THE long winter nights are close upon us, and every evening lamps have to be lit a little earlier. The article published elsewhere in this issue under the above heading will therefore be of particular interest to readers who contemplate doing any amount of motor cycling by night. The speed of a motor cycle, however moderate, entails the use of a bright light which will illuminate the road at least fifty to sixty yards ahead of the rider. Apart from this question of illuminating the road, a bright light at night is more companionable than a dim one which barely illuminates the hedges on either side; sometimes, unfortunately, a poor light is also the rider's undoing. The law, although it makes it compulsory for vehicles to carry a light, allows a drove of cattle of any size to be driven on the highway at night, and as the movements of cattle are almost inaudible, at least to a motorist, the fact that one is likely to meet either straying cattle or those in charge of drovers should be sufficient cause to induce motor cyclists to see that they carry not only a perfect lamp, but one well trimmed and ready for use. There are numerous other dangers encountered on the roads after dark, but cattle, singly or in droves, are certainly the most common.

In the case of acetylene gas lamps, only the very best carbide should be used; the carbide should be carried in a carbide carrier, tightly packed to prevent as far as possible the formation of dust. The reason it should be carried in a separate compartment is because the formation of the above mentioned dust gets into the water valves and other passages of the generators and prevents the flow of water and gas and the proper functioning of the lamp. It will not be

out of place at this season to reiterate the well-worn hint with regard to acetylene gas lamps, viz., that after use the flame should never be allowed to die down of its own accord. Either blow the flame out after turning off the water supply or pinch the rubber tube, if a separate generator, and leave the remaining gases in the container to escape through the burner. If the machine has to be brought into a dwelling house remove the carbide container and leave it outside. The water tank or compartment of the lamp or generator should be frequently washed out, and as far as possible water should be used which is free from foreign matter or particles.

Oil, Gas, or Electric.

IN the case of electric lamps it is quite as essential to see that the accumulator is fully charged before setting out. If the machine is magneto ignited it will be necessary, of course, to carry a separate battery, but in the case of a battery ignited engine the lamp can be run off the same cells as those used for igniting the charge in the engine.

Oil lamps are seldom used on motor cycles, as the light they give is hardly sufficient to perfectly illuminate the road for a sufficient distance ahead of the rider. If an oil lamp is used great attention should be paid to its cleanliness. No stale oil should ever be allowed to remain in the oil vessel, and the wick should be frequently changed.

On the question of self-contained or separate generator gas lamps, we certainly must say we lean towards the separate generator, and we think that nine-tenths of the motor cyclists in the country will agree that we are right. The lamp-bracket on a motor cycle is not made sufficiently strong to carry a heavy self-

contained acetylene gas lamp. The consequence is, if one is used, particularly on machines with rigid forks, the jolting very soon breaks the lamp iron and a serviceable lamp is spoilt by being dropped on the road. We have also known accidents to take place through the lamp falling into the spokes of the front wheel. In the case of separate generator lamps the heaviest portion—viz., the carbide and water container—is carried on a bracket attached to a part of the machine where vibration is not so great or where the parts are made sufficiently strong to hold it. This leaves the lighter portion—the lamp body, reflector, and glass—to be carried on the lamp iron in front. We also think that the tube connecting the generator to the lamp is an advantage rather than otherwise, as it acts in a way on the lines of a gas reservoir, and enables a fairly steady supply of gas to reach the burner. On the question of attachment of the generator to the machine, there are various devices on the market for this purpose, the most popular being a bracket which screws by means of clips to the front forks. This is hardly an ideal method of attachment, as the clip is very liable to slip down the fork sides, and might cause the spokes of the front wheel to be torn out, if not an unpleasant accident to the rider. A lamp iron on the forward tank clip, enabling the generator to be fixed at the side of the tank, is a far better plan, but seldom adopted by manufacturers of complete machines. One or two makers of the latest types of separate generators have adopted a position behind the seat tube, and for a motor bicycle this is almost ideal. The generator is out of the way, and although it entails a long length of rubber tubing to reach the lamp, it occupies practically

the only space left on a motor bicycle where it can be readily fitted and be free from injury.

With regard to the carriage of accumulators for illuminating electric lamps, two or three positions have been tried, and in all probability the one last mentioned for generators is about the best, viz., to fit the battery in a compact case behind the seat tube. Some riders carry the accumulator box or case on the front forks, just above the front mudguard. This means shorter wires, but does not look so neat as the seat tube position.

Finally, as to which is the best type of lamp—gas, oil, or electric—it is one of those questions which cannot be answered directly in one word. The style of lamp that should be adopted depends entirely upon the rider's requirements. If he uses his machine nightly for short distances, and wants the light to be ready at a moment's notice, we should strongly advocate a good electric lamp and battery; but if he wants the lamp for long rides, where the utmost light-giving power is essential, then let him choose a first-class acetylene lamp. Again, if the machine is required for very short journeys and to be ready at a moment's notice, an oil lamp is serviceable for town use, where the machine is to be ridden in well-illuminated streets. If the rider possesses more than one type of lamp, all the better; he will not then require to drive a motor cycle through a well-lighted suburban district of London or provincial town with a brilliantly-lighted acetylene gas lamp when he can see all approaching traffic for a hundred yards or more ahead without a light at all. An oil lamp or a small electric lamp in these cases is quite satisfactory, and nothing more is required.

THE GAILLON HILL-CLIMB.

SEVERAL motor cyclists competed in the above event on the 4th inst. In the class for motor bicycles not exceeding 50 mm. bore Pean on a Peugeot won in 1m. 12 $\frac{1}{5}$ s. The speed class was won by Giuppone on a Peugeot. Grapperon on an Alcyon coming second, and Mentel on an Anzani third. The fastest time was 32 $\frac{1}{5}$ s. It is some time since Giuppone competed in any classical event on a motor cycle, for he has of late turned his attention to voiturette racing; but his performance proved that he has lost none of his old dash and form. Grapperon ran him very close, being only one second slower. On the day following the competition it was announced that Pean had been disqualified for pedalling on the hill, and that Vilbois (Lurquin-Coudert) was placed first in the class for motor bicycles not exceeding 50 mm. bore. The manufacturer of the Ronteix tricar has entered a protest against the classification. His mount was weighed as No. 107, and competed and timed as No. 108, and yet the machine was not included in the formula classification; neither was any other motor cycle competing so classified. He also strongly protested against a tricar having been

allowed to start with only the driver on board, this not being permissible according to the rules, except in the racing car classes.

Last year's contest was better supported than it was this year, although better time was made on the 4th.

Cambridgeshire Motor Cycle Club. Competitors at the start of the Consumption Trials. (See page 808.)

Bucquet last year on a Griffon made fastest time—37 $\frac{3}{5}$ s.—on a motor cycle weighing under 110 lbs. This is 5 $\frac{2}{5}$ s. slower than Giuppone's time this year.

The Château Thierry Hill-climb, another important French event, is down for decision on Sunday next, the 18th inst.

For night riding we have for some time relied upon a Model F Autoclipse lamp with eclipsing mechanism, and although of comparatively small dimensions its light-giving powers are wonderful. It is 400 candle-power, and the projective power 200 feet. But the brilliant light it gives is not its only good point, for the lamp is splendidly finished and stoutly constructed, and after carrying it on our motor bicycle for many hundreds of miles it is just as solid and free from

rattle as ever. We mention this, as all riders who have used flimsily constructed lamps know how tiresome they can be. It is certainly a high-priced lamp, but it is obvious that the makers studied quality first, and not cost. The eclipsing mechanism is shown in the accompanying illustration. By altering the position of the operating lever shown on the right, a disc is interposed between the burner and the reflector, thus completely

eliminating the long-distance rays which are so dazzling when riding in traffic, and cause much annoyance. Even when the eclipsing disc is in use a good light is maintained for immediate surroundings. The lamp can be obtained from BROWN BROS., LTD., Great Eastern Street, E.C., with either side or back lamp-bracket, and without the eclipsing mechanism if desired. It weighs 2 1/4 lbs.

We wish we could speak in as high terms of praise for the generator, which works on the diving bell principle; that is to say, gas is generated by water soaking through a capillary pad at the bottom of the carbide reservoir, and after enough gas has been evolved it automatically forces the water away from the carbide, so preventing further decomposition of the carbide. As soon as the gas generated has been consumed, the water again attacks the carbide and a further supply of gas is generated, and so on. But in use the generator only lasts one and a

half to two hours, and is very wasteful with carbide, requiring to be filled each time a light is required, and personally we prefer the ordinary drip-feed generator (which Brown Bros. also supply) on account of its reliability and simplicity. But, though heavy, the Autoclipse generator is very neat and well made, and quite adds to the appearance

The Eclipsing Disc of the Autoclipse Lamp.

The Autoclipse Lamp and Generator, showing the neat method of carrying the latter between the seat tube and rear mudguard.

Autoclipse Diving Bell Generator, with clips for attaching to the seat tube.

of a machine when attached to the seat tube by the clips provided. A drip-feed generator designed to be attached to the seat tube in the same manner would make an excellent combination. The firm also sell the Duco lamp and separate generator, which is a cheaper pattern than the Autoclipse.

THE SERVICE CO., LTD., 292, High Holborn, W.C., supply the Service mirror lens headlight and generator. This lamp has been designed to meet the requirements of those motor cyclists who do a great deal of night riding. The mirror lens is detachable, the front glass is dissected, and the lamp is supplied complete with generator, tubing, and clip for attaching generator to the fork. A carbide carrier is also supplied by the same firm to fulfil a very necessary want, viz., a case in which the carbide may be carried until it is actually required for use in the lamp.

The F.R.S. lamp is the outcome of suggestions made to MESSRS. SAMUEL HALL AND SONS, LTD., of 12, Clyde Street, Edinburgh, by readers of *The Motor Cycle*. The latest pattern F.R.S. has a body made of aluminium and plated brass combined, and the total

Motor Cycle Lamps.—

weight is only $1\frac{1}{2}$ lbs. This is extremely light for a lamp of the size, and from personal experience we are pleased to say that the lamp gives a most excellent light. Its shape follows the popular Rushmore design, and one of the special features is the door at the back as well as the dissected glass door at the front. This door is provided to enable the user to make a tyre repair or adjustment to any portion of the machine which is unlighted by the front rays of the lamp without detaching it from the lamp iron. Two small legs are provided, which allow the lamp to stand on the ground while lit. The size of the lamp under review is—length 5 in., diameter of glass front $4\frac{1}{2}$ in., lens 4 in. The attachment to the lamp iron is simple yet effective, for we have never had the lamp work loose on the lamp iron, although it has been fitted for some weeks to the top of the wings of a rigid-framed tricar. The burner and gas tap are detachable, and a difference can be made in the projecting power of the light by moving the burner nearer to or further from the

F.R.S. Lamp, with the front and back doors open.

lens. The further forward it is put the more penetrating the light becomes. The generator differs in appearance and also in its action from the usual drip-feed generator supplied with motor cycle lamps. The line drawing we have prepared of this generator will show that it consists of two cylindrical parts—A the water chamber and B the generating chamber. C is a long bracket firmly attached to both the chambers. This, when placed against the round seat-tube of a motor cycle, is held in position by two hinged clips which pass round the bracket and the tube and hold the generator securely. Connecting the water chamber with the carbide container is a small pipe E fitted with a tap F, which either allows the water to flow into the carbide container or the gas to flow out from the generating chamber to the air, according to the position in which it is placed. The carbide is placed in the drum H, which is provided with a cap at each end, and a handle at one end for withdrawing it from the container. In the centre of it is a tube K perforated with holes, through which passes another tube L, forming

the tubular bolt locking the end cap on the container. The water from the tap F flows through a centre tube M, this latter being a continuation of the small pipe

The F.R.S. Separate Generator.

| E. Water pipe. | M. Centre tube of generator. |

outside, through which the water flows from the tank. It is claimed for this generator that it is perfectly automatic in action after turning on the tap. There are only two positions for this, viz., full on or full off, and the amount of gas required for any burner will be generated. Since receiving the generator for trial we have not been able to test this claim, but hope to do so shortly. In ordering the generator, it is necessary to state if it is to fit the forks, side of tank, or seat tube of bicycle frame. The F.R.S. generator will light a very large burner for six hours and a smaller one for ten hours, such as a $17\frac{1}{2}$ litre burner. It is, of course, connected up to the lamp or lamps by means of a rubber tube in the usual way.

POWELL AND HANMER, LTD., Chester Street, Birmingham, are an old-established firm of bicycle lamp makers, and have specialised in motor cycle lamps. The two patterns they make are a self-contained lamp

Powell and Hanmer Headlight, with separate generator.

and one with a separate generator, which we illustrate. It will be noticed that the generator has an adjustable bracket for securing it to the fork or any other part of the frame where it is required to be attached, and

Motor Cycle Lamps.—

no matter to what part it is fixed it can always be set in a vertical position. The lamp has a large front with hood reflector to throw the light down on the road. The lens is double convex, and the reflector is made of aluminium. Unfortunately we have not had samples of these lamps sent to us for inspection, so it is impossible to give a detailed description of the way they are fitted up and the method in which the separate generator operates, but the illustration of the lamp and separate generator is practically self-explanatory, and the length of time the firm have been established is sufficient proof that their workmanship can be relied upon.

The Kerry-Hella is an exceedingly well-made acetylene gas lamp, placed on the market by the EAST LONDON RUBBER CO.,

2, 4, and -8, Great Eastern Street, London, E.C. It is certainly one of the best finished lamps we have ever examined, and it can be supplied in polished brass or nickel plated. The lamp body is strongly riveted, no solder being used in its construction. The front glass is dissected, and a glass mirror lens is provided. The novel method of fitting the lamp bracket at the back is worthy of mention. Instead of it being plainly riveted, the ends of the bracket are tucked inside the body of the lamp, so that it is almost impossible for it to be shaken loose—a not infrequent habit of heavy lamps with weakly fitted brackets. Two sizes of separate generators can be supplied. The small size measuring 6in. by 3in. will burn three and a half hours, and the larger pattern (8in. by 3¾in.) for six hours.

The "Glare" electric headlights for motor bicycles and tricar have been previously referred to in these pages. Their speciality is light weight combined with an adjustable bulb. The lamp body is specially shaped, and the bulb is screwed into the back of the lamp in such a way that it can be placed nearer to or further away from the front glass. The nearer the bulb is brought to the glass the further the light is projected. The bulbs consume rather more current than some others, but give a very good light, their chief advantage being

that they can be used with a four-volt battery. The makers' address is J. W. Greenwood, Ltd., Portland Place Works, Halifax.

Glare Electric Headlight of small dimensions and very light weight.

The Kerry-Hella Headlight.

A. W. GAMAGE, LTD., Holborn, supply no less than five different motor cycle gas lamps. Three different

"Nulite" Lens Mirror Headlight. Note the dissected front glass.

patterns are illustrated in this article, viz., the Nulite lens mirror headlight, British made, riveted throughout, and fitted with Bray's Cyka burner, finest quality 4in. mirror lens, and dissected 4in. diameter front glass. This lamp is obtainable in polished brass or nickel plated and with side or back bracket fitting at the same price. The separate generator is a stoutly constructed article made to withstand rough use. Holborn condensing lens motor bicycle or tricar headlight. The size of this lamp over all is 6in. deep, with a front glass 4in. in diameter, the lens being 2in. in diameter, mounted on a screwed-on tripod, which is detachable if desired. It is provided with an aluminium reflector and atmospheric burner, and the price with separate generator is extremely moderate. This is a lamp of rather light construction, yet, it is claimed, quite strong enough for motor cycle work. Another type of Nulite separate generator headlight has a well-shaped hood and cowl, aluminium

The "Holborn" Motor Bicycle or Tricar Headlight, with condensing lens.

Gamage's "Nulite" Separate Generator Headlight.

reflector, powerful front lens 3¾in. in diameter, is English made, riveted throughout, and heavily nickel plated. The back bracket is provided with a fixing screw with lock-nut to lock the bracket firmly to the lamp iron. The burner is one of Bray's Cyka burners. In addition to the three above mentioned types, Messrs. Gamage also supply the Nulite self-contained headlight, which is practically the same as the one last mentioned with hood and cowl, except that it is self-contained and fitted with a stout gas bag to provide an even feed of gas to the burner. With this lamp is provided a special sprung fork bracket with round clip for clamping to the handle-bar stem, or a flat clip for clamping to the ordinary lamp iron. It will burn for over four hours. It is heavily nickel plated, and, in addition, is provided with a bail handle. The New Century is a separate generator lamp of ordinary pattern provided with a central lens,

Motor Cycle Lamps.—

4¼in. glass and 2¼in. lens. The reflector is highly polished, and the burner is a Bray's Cyka burner. The burner holder is detachable for cleaning purposes, the body is riveted throughout, and an extra strong bracket is provided for back fixing. This is a smart little lamp, British made throughout, and sold at a remarkably low figure. Those of our readers who wish to see illustrations of the whole of the motor cycle lamps supplied by Messrs. Gamage should write for the catalogue called "Everything for the Motorist." This can be obtained free on application to the above address, and contains illustrations of all the lamps we have described in addition to those for which we have not space in this article.

The Electary mirror lens acetylene projector and the Electary electric head lamps and side lamps are made by MESSRS. W. AND R. JACOBS, 39c, King William Street, E.C.

Jacobs's Electric Headlight and Metal-lined Case for Accumulator.

The acetylene projector is a stout gauge brass lamp with adjustable focus burner pillar. The dissected front glasses are all fitted into a separate metal flange before being attached to the lamp front, so that all chance of rattling or movement is avoided, and any of the glasses can be replaced at a moment's notice if the original is broken at any time. With the electric head and side lamps are now included a genuine Osram metallic filament bulb. These

Jacobs's "Electary" Side Lamps for Tricars.

burgh run was still giving its light long after many of the gas lamps had gone out, choked up, given trouble,

and caused delay. The firm supply, in addition, cheaper types of motor cycle head lamps with separate generators, and for use with the electric lamps special seven hour four and eight volt accumulators in tin-lined leather cases, with straps complete for attaching the case to a machine.

(To be continued.)

"THE AUTOCAR" LECTURES.

THE series of weekly lectures on the motor car which are being organised by *The Autocar* throughout the country commenced at the London centre yesterday, Tuesday, October 13th, in the small hall of the Queen's Hall, Langham Place, W. The complete list of dates at the various centres is as follows:

LONDON.—Queen's (Small) Hall, Langham Place, W. Tuesdays, October 13th, 20th, 27th; November 3rd, 10th, 17th, 24th; and December 1st at 3.30 p.m. and 8.30 p.m. (tickets available for either).

BIRMINGHAM.—The University, Edmund Street, at 7.30 p.m. Wednesdays, October 21st, 28th; November 4th, 11th, 18th, 25th; and December 2nd and 9th.

LEEDS.—The University, College Road, at 7.30 p.m. Thursdays, October 22nd, 29th; November 5th, 12th, 19th, 26th; December 3rd and 10th.

MANCHESTER.—Geographical Institute, The Parsonage, Deansgate. Fridays, October 23rd, 30th; November 6th, 13th, 20th, 27th; December 4th and 11th, at 4 p.m. and 7.30 p.m.

NEWCASTLE-ON-TYNE.—The Armstrong College. Mondays, October 26th; November 2nd, 9th, 16th, 23rd, 30th; December 7th and 14th.

There will be a discussion after each lecture, and the lecturers will deal with any special points desired by those who attend. We cannot too strongly urge our readers not to miss the opportunity these lectures offer for the obtaining of a sound practical knowledge of motor matters. They will prove of especial value to motor cyclists who hope one day to be car owners.

The lectures are an educational effort on the part of *The Autocar*, and the fee (£1 1s. for the course) is fixed as low as possible. Affiliated members of the M.U. may obtain tickets for the course at 12s. 6d. each. Applications for tickets should be made immediately to the Lecture Secretary, *The Autocar*, 20, Tudor Street, London, E.C.

A member of the Liverpool M.C.—Mr. J. Pickering—usually attends at club runs and competitions on his "good old trike." He has ridden it for years.

Questions... and Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Pitting of Contact Points.

? Please help me out of the following difficulty: The fixed platinum point on the contact breaker of magneto of my 1905 Triumph has practically vanished after about 700 miles running. This excessive wear did not commence until I put in new points. The point on the rocking lever has not worn, but has become pitted and black. I have cleaned the two carbon brushes, the brass cap, and both ends of the spring which holds the cap in position, and the screw securing the spring to the condenser terminal, but it did not stop the wear.—E.S.

Experiences such as yours are, fortunately, extremely rare, and we can only think that you have been supplied with a metal which is not suitable for the purpose.

Governor Control and How to Prevent Spilt Acid.

? I have just fitted a $3\frac{1}{2}$ h.p. Fafnir engine and B. and B. carburettor to my cycle, and shall be glad if you will tell me the best way to drive? (1.) I set the spark and throttle for top speed and control speed by the governor, as I find that if I set at half throttle and have to slow down almost closing the governor, the engine will not pick up again, but stops dead. (2.) I wedge the accumulator down in case with a long set screw and it cannot move, but find that the vibration spills out half the acid each time I go out. How can I avoid this? I have put a piece of rubber tubing on each vent, but this does not stop it.—LN 3980.

(1.) If the governor mentioned controls the lift of the inlet valve we should recommend you to set the throttle almost fully open and control by the governor and spark lever. Naturally, if you do not retard the spark when attempting to run slowly the machine will come to a standstill owing to ignition being too far advanced for the speed. There is no reason why throttle should not be open if you use the governor control, as the engine cannot draw in a

full charge of gas, no matter what opening of throttle, if the governor is working properly. (2.) The accumulator vents should be connected with a piece of small diameter indiarubber tubing in the form of an arch with a small hole in the centre at the topmost point of the arch. This will prevent spilling of acid to a great extent.

Cost of Running a Passenger Machine.

? (1.) Does it cost less to run a bicycle with sidecar than a tricar? and is the cost of buying in first instance less? (2.) Would $3\frac{1}{2}$ h.p. be enough for touring purposes (not in the hilliest districts) if I had a change-speed gear?—W.P.

(1.) A $3\frac{1}{2}$ h.p. bicycle with sidecar would be slightly cheaper to run than a $3\frac{1}{2}$

Gordon Gibson asking J. Marshall how he does it. (And apparently he was told in time for the last Brooklands race.)

h.p. tricar, owing to the reduced weight on tyres and lower petrol consumption. The sidecar combination would also be a little cheaper to buy. (2.) It would not be wise to go under $3\frac{1}{2}$ h.p. with two speeds for passenger work. Suitably geared, and with passengers not exceeding twenty stones you could tour in most counties without meeting unclimbable hills.

Lubrication of an Engine.

? I recently removed the cylinder of my $2\frac{3}{4}$ h.p. Minerva motor bicycle engine so as to clear it of the carbon deposits. Finding it difficult to remove the deposit owing to the cylinder being all one casting I decided to bore it. I therefore placed it in a pan of cold water, to which I added a quantity of paraffin and a handful of common washing soda, and then let it boil steadily for about half an hour; this had the desired effect of thoroughly cleaning the cylinder of all foreign matter. I next turned my attention to the crankcase; this I swilled out with paraffin and then let it all drain out. Having scraped the piston head I replaced the cylinder. Next day I started off for a run; on leaving the garage I gave the engine four pumpfuls of oil (Vacuum B air-cooled). I then sped along for a mile and a half, the engine purring away quite distinctly. I then stopped for a flock of sheep to pass. Upon restarting I could hear squeaks from the engine, so I dismounted (within twenty-five yards of starting place) only to find that it had seized. I therefore slipped off my belt and "pushed" home. After tapping away for nearly an hour I got the piston out. I could then re-insert it in cylinder, and it worked well with the exception of getting very tight at the bottom of stroke. (1.) Did I do the right thing to boil cylinder? (2.) Did I give enough oil before starting? (3.) Do you advise reboiling of cylinder and new piston? (4.) Should not the engine have given warning of overheating or seizing?—GOODIE.

(1.) You could not damage the cylinder by boiling it, because the temperature 212° Fahr. is very much under the temperature reached by an air-cooled engine under normal conditions of running. (2.) Yes. Four pumpfuls should be ample, but you may not have assembled the piston correctly on the crank rod, or you may have changed the position of the rings; or the oil sold to you at the garage may

have been genuine air-cooled vacuum B. Another point is, who assembled the engine? It should have been thoroughly oiled everywhere before being put together, so that the oil pumped into the crank chamber would follow the lead. If the parts are put together dry it is very possible that the splashed oil would not reach one of the bearings immediately, and so a seizure would take place. (3.) The engine ought to run all right if assembled properly, without it being necessary to rebore the cylinder. (4.) Not necessarily.

Single v. Twin-cylinder Machines.

I am purchasing a new machine. Kindly tell me—(1.) Do you recommend twin-cylinder engines in preference to single-cylinder engines? (2.) Is the vibration less on twin engines? (3.) Is there greater wear with twin or single engines as regards expenses of tyres, etc.? (4.) Will a Triumph motor bicycle pull a sidecar with passenger, say, twelve stones and driver twelve stones, and is there any extra license to pay for sidecar, and which sidecar do you recommend, at least which fittings for coupling up?—C.E.R., Yorks.

It entirely depends for what purpose you intend to use the machine. Both types have their uses, but a novice perhaps better off with a single-cylinder machine owing to its simplicity. (2.) Vibration is less on twin-cylinder engines of the V-type. (3.) A 5 h.p. engine of 5 h.p. would wear out tyres sooner than a $3\frac{1}{2}$ h.p. single-cylinder, but not quicker than a 5 h.p. single-cylinder, if as quick, and likewise a $3\frac{1}{2}$ h.p. twin would not wear out tyres any quicker than (if as quick) a $3\frac{1}{2}$ h.p. single-cylinder. (4.) Twenty stones is a heavy weight for a $3\frac{1}{2}$ h.p. engine, and without a two-speed car a little beyond the limit. There is extra license for a sidecar. The price of a sidecar is more a matter of personal taste than anything.

Concerning Compression.

I have a $2\frac{3}{4}$ h.p. Kerry bicycle, and am desirous of fitting new piston rings. (1.) Would any $2\frac{3}{4}$ h.p. make of rings do? (2.) May I look forward to increase of compression? (3.) Must ends of rings be as far apart as possible? (4.) When grinding in an exhaust valve, is it necessary to file the bottom of valve, as in grinding the seating the valve drops a fraction, and if the end is not filed I take it the valve cannot close properly, as it is made too long. Am I right in this? (5.) Will a stronger exhaust spring also improve power? (6.) I ground exhaust valve last week, and instead of improving engine it ran worse. There was hardly any compression at all. All joints tight, etc. Could not start for some time until I slightly filed end of valve which seemed to improve it, and I at last got a start. What do you think was the cause?—W.A.

No, you must send to the makers, the East London Rubber Co., Great Eastern Street, London, for the rings.

(2.) Yes, if properly fitted. (3.) No, as close together as possible, allowing for expansion through heat. (4.) If distance between the end of valve and top of tappet is less than a bare 1-32in., the stem must be filed, not otherwise. (5.) Extra strong springs may break head off valve, and also put a strain on timing gear, but if the one now on the engine is old, it has most probably lost its temper and a new spring would improve the running. (6.) It is not unusual for compression to be absent immediately after grinding the exhaust valve. Run the engine for a few miles and the compression will return. Probably in your case the valve stem was too long.

Vibration, Hill-climbing, and Tubes.

Kindly tell me what devices I can purchase for my Triumph to minimise vibration. I am going a week's tour in Devonshire next week. Shall I be able to climb all hills without using the variable pulley? My weight is twelve stones with luggage. I propose carrying a spare tube. Which is the best of the detachable variety?—B.R.

Spring seat-pillars render riding more comfortable, also an extra large springy saddle. If your tyres are blown up too hard you will notice the vibration more. It is hardly likely you will be able to climb every hill in Devonshire on the top gear, but if you carry a spare belt giving a gear of about 5 to 1 when the variable pulley is altered, you should be able to surmount any hill. There are several makes of butt-ended tubes, and also several makes of tubes with detachable ends, i.e., those giving a continuous air current. If you adopt our rules we will place a list in order of merit for you.

Unequal Power in Two Cylinders.

I have just cleaned cylinders and valves of my 5 h.p. J.A.P. Compression of front cylinder is slightly better than back. Spring front inlet valve slightly weaker than back one. Sparking appliances in perfect order. Synchronisation practically correct. Cannot detect any leak in inlet pipes. On the road the back cylinder does much more work than front one. When throttled down the front cylinder does practically no work, only firing now and then, and runs nearly cold. On the stand, with the contact breaker connected separately for each cylinder, the spark has to be much more advanced to start front cylinder than back one, and even then the engine runs much more slowly. Accumulator and plain coil ignition. A solution will be gratefully received by—O.J.P.

The compression should be equal in both cylinders, and strength of valve springs (both inlet and exhaust) should be equal. Likewise the openings of the inlet valves should be exactly the same—not more than 3-32in. You could try the experiment of changing over the valves and wiring, and noticing if you experienced the same trouble. Synchronised ignition is best for V-type engines.

Constant Pitting of Exhaust Valve.

The compression of my 1907 Quadrant will bear my weight for about half a minute on the pedal after grinding in the valve, but by the time I run about ten miles the compression is practically gone, and the machine fails to climb hills which it can fly up when compression is good. Carburetter is a B. and B. 1908, handle-bar controlled, and fitted with an adjustable nipple. The engine gets a little hot but nothing extra, and to make sure that I have not been running with too rich a mixture I open the extra air till I hear a pop back in the carburetter, and then close the lever slightly. Taking out the exhaust valve after a run I find that it is all charred, and takes a lot of grinding to make it right. I may say this is the second valve I am using, although I lubricate freely.—H.B.

The charring of the exhaust valve may be due to the worn timing gear having reduced the proper lift of the valve. It should lift about $\frac{1}{4}$ in. We should advise you to check this, and also to fit as large a silencer pipe as possible with only gradual bends in it. If the silencer is choked this might account for the trouble. If you are still unable to cure the trouble you should try a new valve of special material, such as nickel, or with castiron head.

READERS' REPLIES.

A Tip to Triumph Users.

It occasionally becomes necessary to remove the rear wheel of a motor bicycle to insert either a new tube or to fit a new cover. The first operation of a Triumph rider is to undo the chain bolt to take off the chain, but this is unnecessary, as wheel can be taken out and replaced without undoing the chain at all. In replacing a wheel single-handed, it is a good plan to strap up the wheel to the carrier while the axle nuts are screwed up.—T.T.

Adjustment of Petrol Level.

I have seen a number of queries lately re adjustment of petrol level in F.N. carburetters, and I have hit upon a plan which I think might be useful. I have made a needle similar to the original and the same weight, but instead of having the little brass flanges soldered on, I have turned a screw thread on top part of needle and made two small iron flanges to screw on. I can by screwing these up or down readily alter the level of petrol in the jet. I have found by experience that to get the best running it does require altering from time to time; possibly the specific gravity of the fluid varies. The level can also with advantage be slightly lowered after the engine has been running for some time warmed up.—R. A. CAMPBELL.

The World's Hour Record Broken.

ON Thursday last that skilful and daring rider of Matchless motor bicycles, C. R. Collier, made an attempt at breaking the hour record at Brooklands with no small amount of success. A gloriously sunny afternoon—one of the many which this splendid St. Martin's summer has provided—with little or no wind, favoured the attempt. The machine used was the 7-10 h.p. Matchless twin-cylinder which as No. 4 was ridden by H. V. Colver in the Tourist Trophy Race; it is British-built throughout, and a few details concerning it may not be out of place. The motor is a twin-cylinder J.A.P., dimensions 85 x 85, Longuemare carburetter. The valves, which are mechanically operated, are situated on the top of the cylinders, and are worked by overhead tappets, the rods being kept down on the cams by means of light

Peugeot on the Parc des Princes track, Paris, on December 9th, 1905, who covered 63 miles 1,078 yards. This splendid record made by Collier should do much to encourage motor cycle track racing. Now that a British machine holds the world's record international enthusiasm should be aroused, and continental riders may seriously attempt to beat the Englishman on his own ground, while other British motor cycle makers will probably not be content to leave the laurels of victory with one firm. Messrs. Collier and Sons, Ltd. deserve the heartiest congratulations on their success, which they have adequately earned by their enterprise and stolid perseverance. As regards Collier himself, it may be truly said that he rode magnificently; he leaned over very little on the corners, and rode very low down on the banking.

H. H. Collier congratulates his son on a splendid performance. Notice how fresh C. R. looks, notwithstanding the terrific speed he maintained.

C. R. Collier and the twin-cylinder machine on which he created a new world's hour record of 70 miles 105 yards last Thursday.

check-springs. The ignition is by coil and accumulator. The coil is a special C.A.V. non-trembler, fitted with a highly-efficient condenser, and the accumulators are by the same maker. The tyres are Dunlops, 26 x 2 1/2 back and 26 x 2 1/4 front wheel. No throttle is fitted, and there is merely the air lever, which is thrown open after the machine is under way, and the spark advance lever. The gear is 2 2/3 to 1.

The Start

At eleven minutes to three the start took place at the end of the finishing straight in the presence of the two timekeepers (Messrs. F. Straight and A. V. Ebbelwhite), Mr. E. de Rodakowski (clerk of the course of the Brooklands A.R.C.), and the representative of *The Motor Cycle*. The start was a standing one, and the engine fired almost as soon as the valve was dropped. Collier soon got the machine into its stride, and it continued running throughout the hour without a falter. The first lap from a standing start was covered at the rate of 63.24 miles an hour, while the fastest lap was at the rate of 72.89 miles an hour.

A New World's Record.

At the end of the hour Collier had covered 70 miles 105 yards, thus establishing the first motor cycle hour record on Brooklands Track, and beating the world's record by 6 miles 787 yards. The previous record was made by the Italian Giuppone on a 12 h.p. twin

while on the straight he kept about eleven yards from the inner edge of the track. The machine was in excellent condition at the end of the ride, but the check-springs on the inlet valves were broken. The Dunlop tyres looked little the worse for the strain which had been put upon them, and the Shamrock-Gloria belt behaved splendidly. Collier complained very much of the roughness of the surface, and stated the drive had been somewhat of a strain. Below we give the speeds at which he covered each lap:

Lap.	Miles per hour.	Lap.	Miles per hour.
1	63.24	14	70.61
2	70.31	15	70.51
3	70.51	16	70.61
4	72.89	17	70.11
5	72.68	18	69.63
6	72.36	19	69.33
7	71.63	20	69.63
8	71.12	21	69.24
9	71.53	22	68.76
10	71.12	23	68.66
11	70.61	24	68.85
12	70.81	25	67.31
13	70.51		

Messrs. Nilmelior (England), Ltd., 36-37, Alfred Place, Tottenham Court Road, W.C., inform us that many motorists do not appear to be aware that the old firm of Bassée-Michel is now merged into that of Nilmelior, and therefore the goods are identical.

LETTERS

THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Two-stroke Engines and Formulae in Hill-climbs

[3596.]—Why does Mr. W. H. Glaser, M.A., advocate a handicap of ten per cent. for two-stroke engines which shows an advantage of only four per cent. in favour of the two-stroke engine, and not nine per cent.?

Length of stroke.		Pressure.		Impulse.		Units per cycle.
100%	x	60 lbs.	x	1	=	6,000
81%	x	38½ lbs.	x	2	=	6,237

STANLEY WORRALL.

Lamps.

[3597.]—In a recent issue of *The Motor Cycle* I noticed in "Occasional Comments," by "Ixion," a small paragraph on "A Lamp Securing Tip." After reading the same I came to the conclusion that a good many riders seem to have trouble with their lamps. If I may be permitted to voice my opinion, I am sure that most of the lamps at present are made far too heavy, which is the cause of all this trouble. I myself have seen and tried a good many different sorts, but none of them have pleased me as much as an electric one I saw advertised in your paper, and which only weighs 8 ozs. With this I get a very good light indeed, and have no fear of breaking lamp brackets, etc., besides being handier in every way.

I have no axe to grind in this matter, but simply write what seems to me a way out of a lot of trouble, and that is have a *light* but good lamp.

M. REEVE.

Hill-climbing.

[3598.]—In letter 3566 Dr. J. C. O'Rafferty has something to say about Mr. I. B. Hart-Davies's climb up "Beggar's Roost" hill, near Lynmouth. He makes such statements respecting the gradients of this comparatively mild hill that I feel compelled to write and correct them. The steepest gradient is about 100 yards above the one and only corner, and is 1 in 5.3, as measured by myself last Easter Saturday. The remainder of the hill is considerably easier, and, excepting for the surface, is quite rideable. The other hill at Barbrook, mentioned by Dr. O'Rafferty, is certainly much nearer 1 in 3½ than Beggar's Roost, and the surface is excellent, as mentioned in my letter in issue of September 2nd, but I notice Mr. Hart-Davies did not roar up this one. Perhaps he was afraid of slipping over the back of his saddle, or the front wheel rearing up and falling on top of him. This is certainly the impression it gives one on approaching it.

HAROLD KARSLAKE.

The Balancing of Petrol Engines.

[3599.]—Some months ago I read in *The Motor Cycle* a description of a method by which the shock and vibration due to the explosion of a charge in a powerful single-cylinder engine might be prevented. This, I believe, was brought about by equalising the weights of certain parts in the engine. As near as I can remember, the details given were not sufficiently clear to induce me to commence operations on my own machine, and, unfortunately, I do not now possess the number of *The Motor Cycle* in which these details appear. If any brother motorist can supply me, through your columns, clearly and fully, with what is wanted to conduce to the aforesaid desirable conditions, he will be earning not only my gratitude, but possibly the kindly feelings of many others who may be in a similar position.

AM 48.

[An article on balancing was published in *The Motor Cycle* of March 18th, and numerous letters followed in these columns, probably the most practical being written by O. Sprey, letter No. 3186, page 225, March 18th.—Ed.]

The T.T. Motor Cycle Race.

[3600.]—With reference to the performance of Mr. J. Marshall on a Triumph in the Tourist Trophy Race in the Isle of Man, there is one curious fact that I should like to see explained, viz.,

that it was publicly stated by the officials that he could barely get all his second allowance of petrol (2 quarts 13 ounces) into his tank.

Now, sir, even assuming that the one gallon served out to him at the beginning of the race quite filled his tank, he must have done the seventy-nine miles in the first half on less than 2 quarts 13 ounces, or approximately 135 miles to the gallon, but at the finish he had 38 ounces left, after emptying carburetter, etc., so that the second half was done on 1 gallon less 38 ounces, or approximately 103½ miles to the gallon, which shows a difference of at least thirty miles per gallon between the first and second half of the race.

INTERESTED SPECTATOR.

[The explanation is, we think, fairly simple. The difference in consumption is due to Marshall having found that he was doing so well in the first round that he could afford to drive faster in the second. In fact, we believe he drove in the second round with throttle practically wide open.—Ed.]

Road Dangers at Night.

[3601.]—As a motor cyclist my recent experiences with sheep and cattle on dark roads may be of interest to others.

Within the last month I have had no fewer than three serious spills from this cause in the neighbourhood of Carlisle. On the first occasion I was riding along quietly at night and overtook a man. As I passed he shouted, but I was into the middle of a flock of sheep instantly, and was pitched off.

Within a week of this, while still in the outskirts of the city of Carlisle, an unharnessed horse galloped at right angles across the road. Of course I hit it as soon as I saw it with sufficient force to throw it down, and I myself was again upset, and the machine smashed.

Within three weeks of this, having had trouble with my engine, I was running down hill one night with my belt off. I heard a shout from the darkness when only about five yards from another flock of sheep, which, even with my powerful lamp, it was quite impossible to see. I had not time to stop before I was again thrown off and badly bruised, and the machine was again damaged.

Surely it is time that steps were taken in this matter. Cannot the county authorities be made to see the partiality of a law which insists on multiplied lights on a narrow and perfectly controllable motor, and yet permits uncontrollable droves of sheep and cattle to occupy the whole of the road without any light or adequate warning?

The remedy for each drover to carry a hand lantern is so obviously simple and reasonable to all but the mysterious rustic, that a byelaw compelling the practice should be at once put into force, for their own protection as well as for that of the unhappy motorist.

C. J. F. MARTINDALE.

Handicapping of Motor Cycle Races.

[3602.]—As a racing motor cyclist of some years' standing, and in the interests of the sport, I consider it is time that some steps were taken to improve the handicapping of motor cycle races.

The handicap at Brooklands on the 3rd inst. has, I should imagine, clearly shown the necessity of attention being drawn to this feature of track contests. In this race, the riders finishing first and second were each allowed

2m. 20s. start, or, roughly, two miles. Now it is perfectly well known to me or anybody else that either of these men could attain a speed of fifty miles per hour on a track such as Brooklands. This means that for the scratch men to even draw level they must travel at a speed approaching eighty miles an hour. A glimpse at the entries reveals the fact, amongst others quite as ridiculous, that a $3\frac{1}{2}$ h.p. had to concede a start of 40s. to the winner on a $3\frac{1}{2}$ h.p. Triumph with an engine 57,000 cubic mm. greater cylinder capacity, and, worse still, a $2\frac{3}{4}$ h.p. N.S.U. 75×75 was conceding 5s. to the same rider, whose cylinder dimensions were 84×86 , and also to a 5 h.p. F.N., which finished second.

Now when it is borne in mind that these identical machines have, by the abnormal starts allotted to them, finished first and second in no fewer than three important events within the last few weeks, I think everybody will agree that it is high time something was done to improve the handicapping. The general dissatisfaction expressed amongst the competitors at Brooklands can only have a detrimental effect eventually upon the sport.

C. R. COLLIER.

Competitions and their Value.

[3603.]—Why cannot these be given in a tabulated form, so that the reader may see at a glance how the various machines have performed?

The question of ratio of gear is important in hill-climbs (as mentioned by a previous correspondent). A report that a $3\frac{1}{2}$ h.p. ——— alone climbed the hill without pedalling astounds the world, but if this machine is geared 10 to 1 and all the others have touring gears, say $4\frac{1}{2}$ to 1, the fact is no longer wonderful.

The club secretaries have (or should have) these details; the belt gear can easily be checked by an official and a piece of chalk. Even if all trials cannot be fully reported, surely the leading trials might be so dealt with—the M.C.C. Consumption Trial, for instance.

I am not blaming your excellent paper in any way. I feel certain the fault is with those responsible for sending in the reports. I would suggest something like the following:

CONSUMPTION TRIAL.

Rider	Machine	Order on formula	Weight of m'chine	Weight of rider.	Petrol allow- ance.	Distance covered.	Miles per gallon.
Jones	$3\frac{1}{2}$ Squib	1	160 lbs.	114 lbs.	2 pints	$25\frac{3}{4}$ miles	103

HILL-CLIMB.

Rider	Machine	Order on formula	Weight of m'chine	Weight of rider.	Time.	Gear.	Miles per hour.
Jones	$3\frac{1}{2}$ Squib	1	160 lbs.	114 lbs.	1m. 8s.	$4\frac{1}{2}$ to 1	33

I would mention that this letter is the result of a discussion between a dozen or so keen motor cyclists on the question of competitions and their value.

R. SAMSON.

Has the Tricar a Future?

[3604.]—I was much interested in Mr. Davies's article regarding the tricar. Being a tricarist myself, I have driven the 1906 type for nine months, in all weathers, and at all times, including a journey from Culross (a place in Fifeshire) to London—a distance of about 435 miles—in two days and two nights, and hence can claim to have had a fair experience of this type.

I cannot agree with "(1) Complete loss of steering control when back tyre bursts" forming a sufficient objection to having the rear part of a heavy tricar sprung. I have had the back tyre suddenly deflate, not burst, it is true, but deflate in 100 yards, while going at thirty miles per hour, and I did not find the steering as unmanageable as he would have us believe. Steering was difficult, but the machine was easily under control, and I was able to pull up at once.

What would happen, it might be asked, if you were in a narrow road or among traffic? My answer would be that it would only be on a wide open road in the country that I should be going that pace. Again, how often does a back tyre, or any tyre burst? I have ridden motor cycles for some years, and never had a burst yet. I certainly would not exchange the immense addition to comfort and saving of the mechanism from vibration produced by good carriage

springs for the shadowy advantages which might be gained for a second or so if the tyre was by any chance to burst. What guarantee is there that a springless frame under these conditions would be any less wobbly than a spring one?

My specification then would be as follows:

Engine.—Here I am in agreement with him, except that I would bar air and fan-cooled ones. To my mind there is nothing like a well-made system of thermo-syphon cooling.

Frame.—Certainly rear sprung. Can Mr. Davies imagine the effect on the whole machine, not to speak of the carcass of the unfortunate driver, of a 200 miles ride over variable roads in a big tricar with no rear springs? Sprung seats are an abomination.

Drive.—Gears (three speeds) and chain. Reverse essential. Anybody who has to drive a long tricar up to a house in a narrow road and then push and haul at it to turn it round and go back would soon say whether he would rather this operation were performed by the engine or by his own back muscles, with patients grinning at him out of the window.

Weight.—3-4 cwt.

Ignition.—Magneto.

Price.—£60-£80.

Steering.—Wheel.

(Dr.) H. S. GASKELL.

A Commercial Traveller's Experiences.

[3605.]—While the writer derives much benefit from the views expressed in the "Letters to the Editor" columns, he still wants more.

Commercial travellers who have discarded timetables, rail and tramways, in getting about amongst their customers, might relate much that would be of real practical benefit to motor cyclists in general.

The writer had practically given up riding on account of lack of time for the sport, when an opportunity of purchasing a machine on most favourable terms induced him to experiment with it, comparing time and money saved in visiting local customers.

The results are such that now not only local customers, but those quite distant are visited, no matter what the weather conditions may be. My kit and sample case are protected by a covering of Empire cloth, which keeps out the rain, mud, and dust very effectively. I arrive at my destination feeling better than any other means of transportation affords, and with a good appetite. My mount is a 1908 Triumph, with a Mabon clutch, which enables me to comfortably negotiate traffic, no matter how dense. I have the usual footrests, but would not dispense with pedals, as with their aid one can start the engine while on the stand, then throw out clutch, fasten up stand, and glide away as easily as with a car, no matter what the gradient may be; the pedals assist the clutch on grades in starting, and the handle-bar control effectively prevents engine from racing. One can coast the hills as silently as on a push bicycle by throwing out the clutch and stopping the engine, while the inertia will restart the engine when nearing the bottom of the grade. A mackintosh and leggings effectively defy the elements in wet weather, while the feet may be kept dry with the usual rubbers worn by pedestrians.

Rubber-studded tyres prevent side-slips, while the saddle position is low enough to kick out against the ground should the rear wheel skid, or both feet may act as emergency brakes assisting the front rim brake, although the rear driving rim pedal brake is very satisfactory in most cases. A Shamrock studded tyre and belt by the same makers do excellent service. If petrol gives out, you may get home safely on paraffin, for that has been my experience far away from any petrol supply. My tyres have never been off the rims as yet, and my magneto has never (barring a burred contact) given me any trouble, despite the fact that it has no cover.

One difficulty in entering strange towns is in finding a place to put up for the night where accommodation for the motor cycle is to be had, and while some places will do in cases of necessity, still one does not care to require help to ascend steps in getting in and out, and one would like to have the opportunity of cleaning and tuning up before starting again in the morning. The Great Central Hotel in Loughborough, the King's Head Hotel in Coventry, and the Denmark Hotel in Manchester have all that is required in this respect, but where to go to in Liverpool (have tried three different hotels) is still a puzzle to me.

Perhaps some other writer may supply this information along with experiences on the road.

SPECIAL FEATURES.

MOTOR CYCLE LAMPS (ILLUSTRATED).

A.C.U. COUNCIL MEETING AT LEAMINGTON.

THE WORLD'S HOUR RECORD BROKEN.

TIME TO LIGHT LAMPS.—Oct. 14th, 6.10 p.m. ; Oct. 17th, 6.4 p.m. ; Oct. 21st, 5.55 p.m.

Next Week's Issue.

Next week's issue will contain illustrations and descriptions of some of the latest motor cycle accessories.

Police Traps.

Every week-end, and on some other days, a trap is working through the village of Fenstanton, ten miles from Cambridge and six miles the London side of Huntingdon.

Motor Union's Membership.

At the end of last month the total number of individual members of the Motor Union stood at 5,843, an increase of 1,406 during the preceding twelve months. Including the affiliated clubs the Union has a total membership of about 15,000.

Motor Bicycle's Christening.

At Woking last week, J. T. Bashall, of Ockham, and G. O. Kyle, of Ripley, were fined £3 and costs for riding motor bicycles at the rate of forty-five miles per hour at Ripley on September 11th. It appears that Mr. Bashall's machine was a brand new one, and after being stopped by the constable the two motor cyclists shook hands and congratulated one another that this was the first time they had been caught, remarking that it was a good christening for the new motor bicycle. At the same court W. H. Bashall was called upon to spend £5 odd of the £15 he won in the Tourist Trophy Race. He was with the two riders above mentioned, and had already several endorsements on his license, which accounts for the higher fine.

Motor Cyclists and the Newhaven Enquiry.

Two witnesses were called by the Motor Union at the Newhaven speed limit inquiry—one, a local doctor representing car owners; the other, Mr. E. F. Young, of Lewes, a motor cyclist, representing motor cyclists. Mr. Young pointed out that it would be most unreasonable to expect motor cyclists to ascend the hill out of Newhaven at a speed of eight miles an hour. It would mean that they would be quite unable to get to the top of the hill without dismounting. In order to meet the objection of motor cyclists, Mr. Rees Jeffreys, who appeared for the Union and the Sussex County A.C., suggested that the speed limit should be extended to ten miles an hour, instead of being eight miles as applied for, and that it should not include the steepest part of the hill.

A Jump in September Imports.

During September eighty-five foreign motor cycles were imported of the value of £2,236, and parts thereof value £3,933, making a total value of £6,169, as compared with £3,088 in September, 1907, and £4,073 in 1906.

Imports during Nine Months.

The number of motor cycles imported during the nine months ended 30th September was :

1906.	1907.	1908.
Number of motor cycles—		
1,593	1,547	1,227
Value of same—		
£46,056	£44,155	£33,194
Value of parts—		
£21,841	£23,714	£21,374
£67,897	£67,869	£54,568

September Exports of British Motor Cycles.

Ninety-nine motor cycles represented last month's British exports as compared with eighty in September last year, and forty-seven in September, 1906. The values of above, together with parts, were :

1906.	1907.	1908.
£3,855	£3,941	£5,388

Nine Months' Exports.

While the number of motor cycles exported during the nine months ended September 30th has increased, the value of the parts has decreased several thousand pounds, as will be seen by the following figures culled from the Board of Trade returns :

1906.	1907.	1908.
Value of complete machines—		
£16,857	£18,941	£22,578
Value of parts—		
£21,898	£20,575	£15,515
£38,755	£39,516	£38,093

Of the above, British South Africa has taken £4,347 worth this year.

Re-exports of Foreign Machines.

£1,587 worth of complete machines, and £7,100 worth of foreign parts, have been re-exported from this country during the nine complete months of the present year.

Sequel to an Irish Hill-climb.

At the Belfast Recorder's Court on the 23rd ult., Alex. Bullick, of Belfast, sued the Motor Cycle Union of Ireland for the recovery of £1 10s., of which £1 was in respect of a prize won by him in connection with the Carnmoney Hill-climb on May 9th, and 10s. the amount

of the protest fee. The plaintiff was declared winner of the hill-climb, but owing to some cross currents the M.C.U.I. went back on their decision and served notice for the re-running of the competition. Plaintiff declined to enter into a second race when he was declared winner of the first. Plaintiff's solicitor being unable to obtain all the addresses of the committee, two of the summonses were not served, and his Honour, Judge Fitzgibbon, held that proper service had not been effected, and struck out the case. Since the above action we hear that the Ulster Centre of the M.C.U.I. have paid plaintiff's solicitor £1 10s., the amount of the claim.

A Reminder.

Readers are reminded that if they are owners of motor vehicles they must notify the authorities in the event of any change in their address. We have heard of two or three motor cyclists who have been fined for failing to do this.

The Glanoli Magneto Transmission.

The article describing the interesting magneto transmission fitted to the Moto-Rève motor bicycle, and published on September 23rd, has caused a considerable amount of interest among our readers, particularly those who are scientifically inclined. Mr. Duncan T. M. Sommerville, of the University, St. Andrews, N.B., has very kindly sent us a letter explaining the question of the gearing of two eccentric pinions, and confirms the letter written by "F.P." No. 3578, wherein he says that it is not clear how two eccentric pinions can be made to gear correctly. Mr. Sommerville points out that it is not generally known that the only form for two equal pinions which will gear eccentrically and symmetrically, is the elliptical form. If the pinions in the case of the Moto-Rève magneto transmission are ellipses, Mr. Sommerville points out that they could hardly be distinguished from circles, the major and minor axes being in the ratio of 1,000 : 991. He also points out that a very slight extra clearance in the teeth is sufficient to secure smooth working. We shall be pleased if any other reader can inform us whether the Moto-Rève pinions are true circles or ellipses. In the letter signed "F.P." (published September 30th, page 763), where the letters Q.R. come together they should read 2.R., 2.R. signifying the diameter or twice the radius of the pinion.

Police Traps.

Two members of the Hull A.C.C. have been heavily fined for exceeding the limit at Selby, Yorks.

Sweepstake on the T.T. Race.

Ten per cent. of the total amount of the pool in connection with the Motor Cycle Tourist Trophy Race sweepstake organised by Mr. H. G. Cove was handed to the Wigan Colliery Disaster Fund, and a letter of thanks has since been received from the Mayor of Wigan. The amount handed over was 23s.

Continental v. British Motor Cyclists.

Although motor cycle races were not included in the Olympic Games, they would undoubtedly have furnished more excitement than any of the events figuring on the programme. One or two of the English riders suggested a series of motor cycle contests at the last big meeting of the year at the Stadium on Saturday last, but the executive received such a huge athletic entry that it was regretfully deemed necessary to forego wheel events. Several Continental stars were anxious to compete against the British cracks, and one well-known cyclist offered to bring over his 32 h.p. pacing motor to give an exhibition ride for £100. That is hardly the way to encourage the sport, however.

Numbers on the Mudguard Illegal.

At the Godalming Borough Bench recently B. H. Bramble, of Balham, was summoned for having ridden a motor bicycle at Godalming on September 12th, the identification plate of which was not fixed in accordance with the regulations. Defendant pleaded guilty, and P.C. Lightfoot said the rear number was attached to the mudguard. Supt. Jennings said the numbers were painted one above the other instead of side by side. Defendant was fined 5s. and 9s. 6d. costs.

Quarterly Trial on Saturday.

The A.C.U. Quarterly Trial on Saturday, over the usual course of about 125 miles from Uxbridge to Banbury and back, will bring the 1908 competition season to a close. The competitors will be started at 9 a.m., and will be timed on Dashwood and Amersham Hills. It will be remembered that a silver cup was offered at the beginning of the year to the entrant of the machine accomplishing the best aggregate performance in each of this year's trials. In awarding this cup at the end of the year, the reliability times up Dashwood and Amersham Hills, and strictest adherence to schedule times, will be taken into consideration.

events. The two and twenty miles handicaps were won by C. B. Franklin, who was mounted on the 3½ h.p. J.A.P. which he rode in the T.T. Race. In both of the events he scored very easily. The four miles race was for the Dunlop cup, and by winning the event for the second time in succession R. Walshe (85×60 J.A.P.) made the trophy presented by Mr. J. B. Dunlop, the president of the Union, his own property. The racing concluded with a match between some members of the Dublin and District Motor Cycle Club, which was won by H. McAdoo (3 h.p. Fafnir).

Tourist Trophy Suggestions.

Mr. Noel E. Drury, who was one of the competitors in the Tourist Trophy Race, says that next year he would like to see the cylinder capacity limited as one of the conditions of the T.T. Race, instead of limiting the petrol allowance. He suggests 500 cubic centimetres as the limit for single cylinders and 700 for twin-cylinders. He also wishes to urge the necessity of making the conditions known as soon as possible, say within a month, so that private owners may be enabled to spread the tuning up of their mounts over a longer period. We quite agree with the latter suggestion, and if it is possible to arrange it, the Auto Cycle Union Competitions Committee might reasonably meet as soon as possible and fix upon the conditions for next year's competition, provided, of course, that permission is likely to be obtained to hold it in the Isle of Man. Whether a cubical capacity or petrol allowance limit is the better for the improvement of the machine is questionable. The fuel limit is principally adopted to prevent excessive speeds. A cubical capacity limit would hardly have the same effect, and we think our suggestion to slightly increase the allowance of petrol for the twin-cylinder machines is the one which the A.C.U. is more likely to adopt.

FUTURE EVENTS.

Oct. 17—AUTO CYCLE UNION QUARTERLY TRIAL of Motor Cycles, Uxbridge to Banbury and back.

„ 21—Motor Union General Committee Meeting.

Nov. 13 21—Olympia Automobile Exhibition.

„ 18—Motor Union Annual Dinner at the Hotel Great Central, London.

„ 20-28—THIRTY-SECOND ANNUAL STANLEY SHOW, at the Agricultural Hall, Islington.

„ 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.

Dec. 16.—Motor Union General Committee Meeting.

Motor Cycling Speed Trials at Portmarnock.

On Saturday afternoon, on the Velvet Strand at Portmarnock, the members of the Dublin centre of the Motor Cycle Union of Ireland held their concluding speed trials of the year. The programme was made up of three handicaps and a match, and with the sands in good order and a calm afternoon, some fast times were recorded in the various

The A.C.U. Council Meeting.

THE Auto Cycle Union held a Council meeting of delegates of private members, delegates of members of the R.A.C., and delegates of clubs affiliated to the A.C.U. at the Regent Hotel, Leamington, on Saturday last at 3 p.m. The following members and delegates were in attendance:

Representing the R.A.C. and private members of the A.C.U.: Messrs. Victor Hart (in the chair), C. A. Smith, Martin J. Duncan, E. J. Chapman, O. H. Hawkins, A. G. Reynolds, T. D. Blanch, H. G. Cove, H. C. Ebbutt, D. K. Hall, J. W. G. Brooker, W. H. Wells, L. M. Meyrick Jones, and F. Straight (secretary).

Representing affiliated clubs: Messrs. E. G. Young, Nottingham M.C.C.; E. W. Ashworth, Hertfordshire County A.C.; H. C. Pickering, Worcestershire M.C.C.; F. A. Hardy, West Essex A.C.; A. M. Tatham, Crewe and District M.C.C.; S. W. Carty, Newcastle and District M.C.C.; Richard Booth, North West London M.C.C.; V. A. Holroyd and W. F. Grew, Coventry M.C.; E. W. Winckle, Birmingham M.C.C.; and C. A. Aubert Spring, Nottingham and District M.C.C.

The agenda was published last week on page 777.

In welcoming the delegates to Leamington, Mr. Hart explained that this was their first provincial meeting, and he hoped they would be able to get through the business amicably and with friendliness.

The Work of the Committee.

After the confirmation of the minutes of the last Council meeting, a report was presented of the work of the committee, which stated that since the last Council meeting seven meetings of the committee had been held and twelve meetings of the various sub-committees. The present membership of the Union was as follows: Affiliated members, 2,456; private members, 371; total, 2,827; the number of clubs affiliated being 47. The following new motor cycle clubs had become affiliated: Basingstoke and District, Cambridge University. Bolton and District, Cambridgeshire, Crewe and District. Blackpool and District, Surrey, Purley and District, Sutton Coldfield, Halifax and District, Wakefield, Nottingham and District, and the North-eastern Automobile Association. The agreement between the Motor Union and the Auto Cycle Union had been terminated, and the committee had paid the Motor Union £90 in settlement of its proportion of the affiliation fees to which it would have been entitled during the current year. A new badge embodying the associate badge of the R.A.C.

The A.C.U. Council Meeting.—

had been issued for the use of members, to be exhibited on the handle-bar of their machines. Arrangements had been made for special insurance facilities for members' machines. As a result of a question having been asked in the House of Commons concerning motor cycle competitions on the road, the committee of the Union at once got into communication with the President of the Local Government Board, and pointed out that the rules for these competitions were invariably carefully drawn up and so framed as to prevent the legal limit of speed being exceeded, the competitors also being compelled to drive carefully through towns and villages. The touring department of the R.A.C. had given assistance to a large number of motor cyclists in connection with tours both at home and abroad, and a number of appreciative letters had been received for the trouble taken. A great number of members had availed themselves of the legal department of the R.A.C., the assistance rendered having been of the greatest advantage to those who had sought it. Monetary grants in aid of the defence of members had been made where it was considered desirable. Competitions had been held during the season, for which 348 entries had been received. The Land's End to John-o'-Groat's trial should have a very beneficial effect upon the future touring motor cycle. The results gained and the lessons learned in connection with the Tourist Trophy Race in the Isle of Man also proved that the A.C.U. continued to carry on its good work as a society of encouragement. The committee had carefully considered the establishment of local centres throughout the country, and in June last the provincial clubs were notified that the committee would be prepared to consider the application from not less than eight clubs for the formation of a centre in their district. Correspondence took place with two clubs as a result, but so far nothing further had been heard. The question of instituting a new class of membership at an annual subscription of 5s. had been thoroughly discussed, and had received the earnest consideration of the committee, which had made certain recommendations on the subject. The Finance Subcommittee had carefully gone into the question of the payment of councillors' railway fares, but as the total affiliation fees received only amounted to £237, and the payment of councillors' third-class railway fares would amount to £401 9s. 4d., they were unable to recommend such payments. Steps were being taken to get the Dogs on the Highway Bill well supported when it came before Parliament. The Bill provides that dog owners shall be responsible for any injury caused by their dogs without any evidence of previous evil-doing on the part of the animals; also that damages under £5 can be recovered summarily.

The foregoing report was received and adopted, on the proposition of Mr. C. A. Smith, seconded by Mr. Hall. The former gentleman remarked upon the last clause in the report that at the present time, judging from the result of a case in which he recently took proceedings against a gentleman for damages caused by a dog, the dog was the chartered libertine of the highways to do as it liked.

A Popular Class of Membership.

Mr. E. M. P. Boileau proposed the following resolution: "That a new class of membership be instituted, whereby individual members may be admitted at an annual subscription of 5s." He said he would not detain them very long with observations on this proposal. To put the matter briefly, there were a large number of motor cyclists all over the country who did not belong to any club, and who, apparently, were not likely to, and it was thought that it would be an excellent idea to institute a scheme whereby these people might be got hold of. They could be offered one or two advantages of the A.C.U. for their subscription, and the A.C.U. would then have a register of the majority of motor cyclists in the kingdom, so that whenever any big question of policy, such as the taxation of motor cyclists, came up the Union would have a large number of people to whom they could appeal and whose views they could put before the people in authority. It was quite possible that affiliated club members might think that these new members would interfere with their rights and privileges. He (Mr. Boileau) thought that could be easily overcome by finding out the districts from which these new members came and giving their names and addresses to the secretaries of the affiliated clubs to get hold of those members if they liked; they would thus come into the Union somehow. That was the substance of the scheme. It had not advanced much farther than that. Its object was to get hold of as many motor cyclists as they

could, but they did not want to interfere with the affiliated club.

A member asked what the A.C.U. was prepared to offer these new members for their 5s.

To Increase the A.C.U. Membership.

Mr. Boileau replied that that was a matter for a sub-committee to go into, but he would suggest that touring facilities should be offered principally, but the great idea was to get hold of them.

Mr. W. F. Grew on being invited to give his views said he did not know that he had any particular views to put forward. He was quite in accord with the proposition for getting members into the Auto Cycle Union who would not join in any other way. There were large numbers of motor cyclists who would never think of joining local clubs; they were not sociable men at all, and would not join the A.C.U. except for its touring advantages. He thought such men would join under such a scheme as that proposed by Mr. Boileau, provided they could join at a reasonable rate.

The Secretary: Do you think it would injure the affiliated clubs?

Mr. Grew said he did not think that it would. There were a good many motor cyclists, at Coventry, for example, a hundred or perhaps a couple of hundred, but only about forty belonged to the Coventry Motor Club. If the others were asked to join they would not do so for social reasons, or for the local competitions.

Mr. Pickering (Worcestershire M.C.): I presume you would let them in without any entrance fee?

The Chairman: That is the idea.

Mr. Pickering: In that case it is more likely to affect the affiliated clubs.

Mr. V. A. Holroyd (Coventry M.C.): Would it not be possible for the affiliated clubs to divide that 5s. with the A.C.U.? If that were done the affiliated clubs would take a more hearty interest in the scheme. You would still have the names and addresses at headquarters.

The Chairman: We might entertain the idea if it goes through.

Mr. Cove, as a member of the Finance Committee, said he would second Mr. Boileau's proposal. He said they ought to get hold of those motor cyclists who did not want to join local clubs. He believed there were many who would join the parent club for its touring or legal advantages, but who would not join the local clubs for social advantages. This sort of man very often joined the local clubs, but he would say to the secretary, "Don't send me any dance programmes." If he could join the A.C.U. direct he would prefer it so as to avail himself of its touring and other facilities. What particular advantages should be offered for the 5s. subscription of the proposed new class of members was a matter for discussion. Personally, he thought the A.C.U. might give them the *Journal* and either the legal or the touring facilities, one or the other, but not both, and it would be an advantage to the new member to be attached to the governing body so far as legislation was concerned. If it could be shown by the affiliated clubs that this scheme would interfere with their membership the promoters would be only too glad to drop it. They did not wish in any shape or form to interfere with the local clubs. It was with the idea of opening discussion and getting the proposal thoroughly threshed out that he seconded the motion.

Arguments For and Against.

Mr. Hardy, in supporting the proposition, said his idea in regard to the scheme was that it was something like a manufacturer introducing samples of his goods to the prospective purchaser; if the purchaser found the goods to his liking he ordered a large quantity. The 5s. class of membership would appeal to the man who was not quite sure whether the Union would do him any good or not. If he was satisfied with the sample he would very likely be induced to increase his subscription and become a fuller member, so that he might be able to get further advantages either by joining under the half guinea scheme or by joining one of the local clubs and being affiliated in that way. As Mr. Cove had said, these points needed to be carefully looked into. Speaking for his own club, which embraced Ilford and part of the Eastern suburbs of London, there were many motor cyclists who did not belong to their club, but whom he should like to see belonging to it. Perhaps they would join under the 5s. scheme. There were some motor cyclists one would not be happy to meet, but at the same

The A.C.U. Council Meeting.—

time would like to have their support in common objects. That was where the 5s. scheme would help. Some whom he had personally canvassed rather put their back up at half a guinea and an entrance fee, but they might be caught very nicely with 5s., and after finding out what the Union was, and what it did for them, they would spring a bit more and become full members.

Mr. Meyrick Jones, referring to Mr. Holroyd's suggestion that the 5s. should be divided between the affiliated clubs and the A.C.U., said it seemed to him that this might be worth while considering, so that the local club could offer its advantages, except those of a social character, if there were such.

Mr. S. W. Carty (Newcastle) thought the new scheme would enter into direct competition with the affiliated clubs. For that reason he could not accept it. He proposed the following amendment: "That this proposition be referred to the committee of the A.C.U. for further consideration, and that they bring the matter up at the next Council meeting with recommendations." At the same time he would impress upon the committee to place the matter before the affiliated clubs and ask for their official views. He thought it was rather a mistake to have it brought up in this way. He for one was going to oppose it if it were put up. As Mr. Boileau had the interests of motor cyclists at heart it would be better to further consider it. He would suggest that it be left over till the next meeting, which would be about the time of the Stanley Show, when a more workmanlike scheme could be brought forward. There were about one-third of the members of his own club whose faces he had never seen; they received the usual club notices and the *Journal* and the usual A.C.U. notices. It seemed to him that this new scheme would take those members from the local clubs; and to lose one-third of one's income was to be rather badly hit. Any motor cyclist who wished to go in for foreign touring could join as a private member for 10s. 6d. The man who would come in merely for the sake of registration would be more likely to be able or willing to pay half a crown than 5s. The man who would be most likely to come in under this new scheme would be the man who at present pays 7s. 6d.

The Hon. Treasurer's Opinion.

The amendment having been seconded,

Mr. C. A. Smith said he opposed the scheme because the ordinary person who owned a motor bicycle had no objection to paying the very low fees now asked. He thought Mr. Carty would be pleased to hear that he (the speaker) was in accord with him, though not as far as the affiliated clubs were concerned. The affiliated clubs only brought in about £240 in the year. It would not make very much difference from the affiliated clubs' point of view. At a recent Finance Committee meeting it was suggested that only the *Club Journal* should be given to these 5s. members. Other gentlemen wished to give touring facilities and legal advice and all sorts of luxuries. He could see that shortly the 5s. man would be on equal terms with the half-guinea man. For that reason he was very strongly opposed to another class of members being formed.

Mr. Chapman, combating the suggestion to refer the matter to the committee, said if it were so referred it would still have to come up before the Council, who might have an enormous amount of business to do at the next meeting, and seeing that nearly all the affiliated clubs were represented at the present meeting, it would be a great saving of time to thresh it out now.

Mr. Boileau pointed out that other bodies offered touring and other facilities for a subscription of 5s.

Mr. Durcan (representing the R.A.C.) said he was rather in sympathy with the speaker who wished the matter settled now. It seemed to him that they were having a game of ping-pong with this matter between one committee and another. The representatives of the affiliated clubs were present, and now was the time to put forward a scheme. The matter had been threshed out in committee; it had been before two committee meetings, and they had spent a good deal of time over it.

Mr. Blanch: Let us settle either to have it or not have it, and if we decide to have it then refer it to committee to work out the details; if we decide not to have it, it will be done with.

Motor Cyclists and the C.T.C.

Mr. Hawkins pointed out that the C.T.C. for their subscription of 5s. gave touring facilities and other advantages.

and they did not mind whether their members were cyclists or motor cyclists. If the A.C.U. did not cater for those people the C.T.C. would. That body was making every effort to gather motor cyclists into its fold, and if the A.C.U. did not institute some arrangement of this sort motor cyclists would go there in all probability.

Mr. V. A. Holroyd said that surely this scheme would touch many outlying districts not covered by affiliated clubs, however energetic, and if clubs were given an interest in the subscription they would give the scheme their support, and many of their objections to it would be removed. At all events it could not be said that the scheme was competitive with the clubs if the profits were shared. There were a number of motor cyclists, lonely sort of people, who would not join any clubs, and there were others who were chummy enough, but the clubs did not want them. Both these classes would come in under the new arrangement.

Mr. W. H. Wells (Motor Cycling Club) said the argument that this scheme would detract from the clubs in general seemed to him absolutely ridiculous. Had any cycling club ever complained about the C.T.C. drawing its membership away? He was not familiar with the C.T.C., but the leading cycling organisation of America—the League of American Wheelmen—never experienced any complaint of that sort. He did not think the 5s. scheme would affect the affiliated clubs in any way whatever. If a man could afford to have a motor cycle and to keep it going he must have a fair income. He thought it was very small to talk about his looking twice at his 5s. He did not believe there would be a half of one per cent. who would leave the local clubs. It would be a grand thing for the A.C.U., and they would get in a vast number of new members.

Mr. Reynolds said this matter was an "old chestnut." It had taken some considerable time for the committee to digest the scheme. It had been threshed out in many ways, and for some time the committee of the A.C.U. were entirely against this 5s. scheme because they thought it would injure their existing club membership, particularly in the North. He believed it was the Northern clubs' proposition in the first instance to promote this cheaper scheme, and now that the committee could see its way to adopt it, some clubs seemed to oppose it. He did not think the clubs had properly considered the matter. From his own experience he did not think the 5s. scheme would in any way whatever interfere with the membership of any club in the country. The principal thing they had to watch was that there were other organisations quite willing to take in the motor cyclists, and the idea was to club motor cyclists together into one body. As the A.C.U. was

The Governing Body in Motor Cycling

it should attract all motor cyclists to itself into one body. On the one hand they had the C.T.C. trying to get motor cyclists, and on the other the Motor Union was doing its best to collect them. The A.C.U. ought, therefore, to go out of its way to attract them. According to the figures published as to the number of motor cyclists in existence, it would seem that the A.C.U. had not got one-ninth part of them. Now, where were those men? The A.C.U. must do something to collect them together. If they would not join the social clubs it was possible they would join in the manner proposed if this scheme were given a chance; but if the scheme were not given a chance it would be impossible to say where they would go. He felt sure it would not interfere with private clubs, but that it would do good all round.

The Chairman's Summing Up.

The Chairman summed up the discussion, and pointed out that the result of the deliberations of the committee was that after threshing it out at several meetings the majority of the members of the committee were in agreement with the proposition. From the point of view of finance they had this to consider: they had two classes of private members—the guinea town member and the half-guinea country member. Since the 10s. 6d. scheme had been in progress during the past year the income had dropped considerably from the private members. That was to say, the idea of commencing the 10s. 6d. membership for country members was that it was thought that it would bring in a considerably larger number than they had before at a guinea, but that view had not been borne out by what had transpired. The increase in 10s. 6d. members did not balance the loss on the other class of membership. It was about £50 out this year, although there had been an increase in the membership. He did not

The A.C.U. Council Meeting.—

think the new scheme would affect the local clubs in the slightest degree. There was a considerable divergence of views as to what should be given for the 5s. These details ought to be settled before the scheme was placed before the public.

Mr. Boileau, in replying on the discussion, said the chief point to remember was that other bodies were trying to capture the motor cyclists, and it behoved the A.C.U., as the strongest body which catered for motor cyclists, to get them all within its fold. If the meeting agreed with the scheme the details could be referred to a sub-committee.

The voting then took place, Mr. Carty's amendment being lost and the proposition carried by 33 votes against 24.

Formation of Centres.

A long discussion then took place upon the question of the formation of centres. Before the discussion of the proposition was reached, a point of order had to be decided as to whether the determination of the Council should have the effect of a new rule. On this point Mr. Hardy moved: "That such propositions appearing on the agenda from this item downwards as are carried shall be referred to the committee of the A.C.U. to formulate the necessary rules." This was seconded by Mr. Winckle and carried.

Mr. Carty then moved his first proposition (a), but the Chairman, by way of explanation, explained that the matter had been before the committee, who had already decided to form centres, and had mapped out the districts. Mr. Carty, however, said he had never heard of any such scheme.

The Secretary said the matter had been published in the *Club Journal*, and he was under the impression that a circular letter had been sent out.

Mr. Carty said he had received nothing except a letter in reply to one which he addressed to the secretary. He asked the secretary to form a centre for the Northumberland district, and the secretary informed him that it would be necessary for him to obtain the support of seven clubs in addition to his own in that particular district. There was not that number of clubs in the district.

Mr. Hardy proposed as an amendment, "That a centre scheme on a geographical basis be put into operation forthwith." Details could be arranged afterwards.

Mr. Hawkins seconded the amendment, and Mr. Carty withdrew his motion in favour thereof. On being put to the vote as the substantive proposition, Mr. Hardy's amendment was carried.

Mr. Carty next moved, "That the Auto Cycle Union enter upon a scheme for uniting the motor cyclists throughout the United Kingdom to obtain an amelioration and mitigation of the conditions under which motor cyclists now labour." After Mr. Carty had made his speech in support of the proposition, it was pointed out by several speakers that the

work suggested could be more effectively done by the R.A.C. than by the A.C.U., but Mr. Carty rather flouted the idea of another body doing this work for them. He suggested that what he proposed could be carried out by a suitable letter to the press, and on this understanding the motion was agreed to.

Another motion by Mr. Carty, "That the third-class return railway and boat fares of all councillors attending Council meetings be paid out of the Union funds," was then discussed. The Chairman pointed out that it was impracticable upon financial grounds. Whereupon Mr. Carty limited his proposal to one councillor from each club, but on a vote being taken it was defeated, only the proposer himself voting for it.

Method of Election.

A proposal by Mr. Carty, "That the councillors and members of the committee representing the private members be elected by postal ballot of all the private members," was rejected after a long and somewhat acrimonious discussion.

Another proposition of Mr. Carty's, bearing on the method of election of the committee representing the affiliated clubs, was discussed. The terms of the motion were: "That the members of the committee representing the affiliated clubs be selected by the councillors of affiliated clubs, voting either personally or by proxy at the general meeting of the Union."

This was seconded by Mr. Reynolds, who altered its terms to the following, and in this form it was adopted: "That only members of the committee representing affiliated clubs be selected by the councillors of the affiliated clubs, and that only members of the committee representing the private members be selected by the councillors of the private members respectively, voting either personally or by proxy at the annual general meeting of the Union."

The business of the meeting being concluded, about thirty sat down to a well-served dinner at 7 p.m., presided over by the Mayor of Leamington, Mr. Alfred Holt, who was supported by Mr. W. Riton Oldham, J.P. After the toast of "The King," the Mayor welcomed the A.C.U. to Leamington, and said he hoped it would not be their last visit. He was a motorist himself, and, provided due consideration towards others was shown, he should do everything to discountenance the setting of police traps. As far as the borough of Leamington was concerned there never had been a police trap there, and he hoped there never would be.

Mr. Gilbert Spicer, a resident of Leamington and a member of the Coventry M.C., to whom the thanks of the A.C.U. are due for making the necessary local arrangements, gave a few particulars of some of the beauty spots of Warwickshire.

Messrs. A. G. Reynolds and F. Straight (secretary) also made brief speeches.

A capital smoking concert was organised by Mr. Gilbert Spicer, who himself contributed two whistling solos.

CLUB NEWS.

Southern M.C.

Below will be found the official results of the club hill-climb which was held on the 26th ult.:

Class 4. Twin-cylinder motor cycles, A.C.U. formula.—1, E. K. Davies (5 h.p. Peugeot), gold medal; 2, B. Patterson (5 h.p. Peugeot); 3, C. Patterson (5 h.p. Peugeot).

Class 3. Passenger motor cycles, quadcars, tricars, and sidecars.—1, H. F. Harding (14 h.p. Etna), gold medal.

Class 5, single-cylinder motor cycles, for the Triumph medal, will be announced later.

Edinburgh M.C.C.

This club held the eighth competition of the season on Saturday, the 3rd inst. This took the form of an open penalty run and hill-climb, for which thirty-four entries were received. The result of the hill-climb was:

MULTI-CYLINDER CLASS.

Competitor and machine.	Fig. of merit.	Time.
1. C. H. Macmillan (5-6 h.p. four-cylinder F.N.)	56	50 $\frac{2}{5}$ s.
2. J. R. Alexander (5 h.p. Vindec)	66	41s.
3. E. L. Matthew (5-6 h.p. four-cylinder F.N.)	69	55s.

SINGLE-CYLINDER CLASS.

1. R. H. Mouat (3 $\frac{1}{2}$ h.p. Griffon)	63	45s.
2. J. Donaldson (3 $\frac{1}{2}$ h.p. Triumph)	75	53s.
3. A. H. Alexander (3 $\frac{1}{2}$ h.p. Griffon)	79	51 $\frac{2}{5}$ s.
4. T. Durie (3 $\frac{1}{2}$ h.p. Triumph)	80	61 $\frac{1}{5}$ s.

In the scratch class for engines of unlimited capacity the fastest time was done by J. R. Alexander on a 5 h.p. Vindec, with D. Cusins (5 h.p. Rex) second. The hill-climb was much enjoyed by all present, and was carried out in ideal weather.

On October 24th this club will close the competition season with another hill-climb, for which classes have been arranged. Full particulars may be obtained from the hon. secretary, Campbell McGregor, 2, Greenhill Place, Edinburgh.

Hull and East Riding A.C.C.

The result of the inter-hill-climb held at Elsham, Lincs, on the 3rd inst., with the Hull and East Riding Auto Cycle Club and Lincolnshire Motor Cycle Club was:

CLASS 1 (under 80 x 80, pedalling allowed).

Rider and machine.	Figure of merit.
J. Guesford (3 h.p. Fafnir-Glanford)	29.4
P. Pell (3 h.p. N.S.U.)	20.5
J. Richards (2 $\frac{3}{4}$ h.p. Minerva)	20.3

CLASS 2 (80 x 80 and over).

G. Bosville (3 $\frac{1}{2}$ h.p. Triumph)	35.8
R. Pearson (3 $\frac{1}{2}$ h.p. Minerva)	29.4
E. J. Bascomb (3 $\frac{1}{2}$ h.p. Triumph)	28.1

CLASS 3 (Twins).

A. Hornsby (5 $\frac{1}{2}$ h.p. N.S.U.)	17.9
A. Heseltine (5 h.p. Rex)	19.4

The annual dinner will be held on the 5th prox.

Club News.—

Harrogate and District M.C.C.

On Monday evening of last week a meeting was held at the Oxford Hotel, Harrogate, to consider the advisability of forming a motor cycle club for Harrogate and district. There was much enthusiasm shown, and the club was formed without any difficulty, the number of members enrolled being no less than eighteen, which is an excellent number for a beginning. The intention of the club is to organise competitions, social events, etc., and to give whatever aid to motor cyclists that the club possibly can. The club is not confined to Harrogate alone, but includes the surrounding

Some competitors in the Rotherham to Scarborough and Back Speed Judging Trial.

district. The committee hope to receive a large amount of support from the district, and Mr. H. W. Fortune, of St. James's Chambers, Harrogate, will be pleased to receive names and addresses of any persons wishing to become members.

Pocklington and District M.C.C.

The above club held a very successful hill-climbing competition on Wednesday last at Kilnwick Hill, the result on formula being as follows:

		M.	S.
1.	J. Forth, $3\frac{1}{2}$ h.p. Minerva	1	28 $\frac{2}{5}$
2.	W. S. Lamb, $3\frac{1}{2}$ h.p. Triumph	1	28 $\frac{2}{5}$
3.	W. Barlow, $3\frac{1}{2}$ h.p. Triumph	1	20 $\frac{4}{5}$
4.	T. S. Suddaby, $3\frac{1}{2}$ h.p. Triumph	1	27 $\frac{4}{5}$
5.	J. Everingham, $3\frac{1}{2}$ h.p. Rex	...	failed.

Rotherham to Scarborough and Back.

A speed-judging and reliability trial from Rotherham to Scarborough and back for a gold medal, given by Mr. Ernest Cross, the local motor cycle agent, took place at the end of last month. There were fourteen competitors, and, with one exception, all completed the 172 miles journey without any trouble. The competitors' machines included seven N.S.U.'s, five Triumphs, and one $1\frac{1}{2}$ h.p. F.N. lightweight. The winner was J. Scott, who was only three minutes too early on the outward journey and two minutes too early on arriving home.

Cambridgeshire M.C.C.

Ten competitors started in the consumption trial to Ely and back, but the weather conditions proved most unfavourable, and, owing to the deluge of rain, all but four retired and sought shelter.

On working out the results they were found to be: 1, W. King, 1 pint 9 ozs. 2 drams; 2, C. W. Wilson, 1 pint 10 ozs.; 3, P. W. Cowell (with sidecar and passenger), 3 pints 3 ozs.; 4, B. L. Peters, 3 pints 14 ozs. A photograph of the competitors will be found on page 796.

A PROMISING ACCUMULATOR CHARGER.

ACCORDING to advices we have received from one of our regular contributors, there is some probability of the electrical rheostat being used for charging purposes. Among electrical engineers it is a known fact that if two strips of different metals are soldered together so as to form a ring, and one of the joints is heated, the other being kept cool, a small current of electricity will flow round the ring. If the metals are very dissimilar thermo-electrically and the difference of temperature between the hot and cold parts is made greater by artificial means, a still stronger current is obtained. This principle has hitherto been put to very little practical use, although sometime employed for gauging temperatures, but it has now been applied in the form of a stove, in which it is claimed a current of sufficient voltage is obtained for battery charging purposes by multiplying the number of strips and joints. The strips are coupled in series and arranged so that their inner ends are close round the flame of the stove, while the outer ends are as far away therefrom as possible. The plates therefore operate excellently as radiating fins. This will no doubt be a great advantage to the small repairer or garage owner, and to motorists who like to do their own charging. The stoves are made in different sizes, and with either oil, gas, or spirit burners. They require no flues, and the price is very moderate. A safety pattern will be shortly introduced on the miner's lamp principle, in which the flame is protected by wire gauze. This will enable the stove to be used for heating garages and workshops. If these

stoves retain their generating powers for a fair length of time (they are guaranteed for a year), they should be a very useful alternative to the systems at present in use. Further particulars may be obtained on application to the Magneto Company, Dreadnought Works, Phillips Street, Aston, who have promised to allow us

Competitors in the first hill-climbing competition of the Pocklington and District M.C.C.

to make a test of one of the charging stoves at an early date.

The N.S.U. Motor Co., Ltd., have moved from Charlotte Street to new and commodious premises, well equipped for repairs and as a showroom, at 186, Great Portland Street, W. The new premises are most conveniently located, and are within easy access of the various railways, tubes, and omnibuses.

OCCASIONAL COMMENTS.

By "IXION."

A Curious Stoppage.

One of my machines suddenly fetched up dead in very bad weather the other day in such wise that I decided in the moment of dismounting that it was an electrical defect I had to search for. Examination proved that a large blob of wet mud had settled on the naked top of the carburettor float needle, and jammed it so that it had permanently cut off the flow of spirit. As soon as this was brushed away the machine started at once.

Chains—and Chains.

It has always been a puzzle to me why some riders have no language too sulphurous for the chain drive, while others assert with a cold and dignified astonishment that their particular chain drive will run for centuries without adjustment or trouble. I used to think it was all a matter of design, but the other day it began to dawn upon me that manufacture might have something to do with it. I have been a faithful user of Renold chains for many years past, and in all the years I have employed them I have never had one break or wear with abnormal rapidity. A month or two ago I took delivery of a new passenger machine fitted with a three-chain transmission, for which I had, according to my custom, specified Renold chains. Imagine my disgust when the first 200 miles trip not only fractured the three chains in the original set, but also fractured each member of the spare set as well. I faked up three fresh chains out of a pile of disjointed fragments and a few odd links, and in the course of this weary process I discovered that the chains were not of Renold manufacture at all. *Verb. sap.*

The Indispensable Belt Punch.

I am rather surprised to find so many riders remain faithful to the ancient bradawl or gimlet for belt shortening purposes. These tools are admirable for their lawful services, but they are about as suitable for drilling holes in rubber or leather belts as a club would be for mending a ten-guinea watch. It is not impossible to make a clean vertical hole with them, but it is so difficult that nine times out of ten the hole will either be out of centre or on the skew. The inevitable result of a hole drilled out of centre or on the skew is that the belt pulls through. The alleged brief life of many belts is generally largely due to the false economy of not spending eighteen-pence on a screw punch. Further than this, the shortening of any belt is done in half the time and with half the trouble by a punch. Altogether I marvel much that our belt makers have not emphasised this very elementary point in such a fashion that no rider should fail to heed them. The punch should further be of exactly the right size for the belt, and of such a pattern that the belt is threaded through an appropriately shaped eye in the centre of the punch. The use of such a punch as this destroys all probability of a fastener bolt tearing itself out.

Wanted, a New Fastener for Rubber Belts.

Our common experience has been compressed into a few letters recently printed describing the more or less ponderous and clumsy methods by which users

of rubber belts safeguard their fasteners from tearing off the inch or so of belting that they grip. The mature opinion of all riders upon the belt question is that rubber belts are the cleanest and most reliable of all belts for our purpose, but that they suffer from two defects, viz., shortness of life and the great liability to "pull through." The shortness of life is a comparative term, as they will always run from 1,500 to 2,000 miles, and many riders are willing to put up with this, since if a leather belt does sometimes achieve a five-figure mileage, it requires a great deal more attention, and is so messy to handle. But the "pulling through" defect is more serious, and ought to be curable. I have seen many attempts at a remedy. The best I have tried was made by an amateur, and was designed to take two screws at each end of the belt, one transfixing it vertically and the other horizontally. It certainly distributed the

A very complete handle-bar equipment seen on the occasion of the Auto Cycle Union Penalty Run. On the right the Royal A.C. Associate badge—the other the A.A. badge (used to good effect).

strain, and prevented the belt tearing across; but it clinked abominably on the pulleys. The sole need is to distribute the strain usually borne by one screw, and concentrated at one point of the belt over several screws piercing the belt at several points. I am inclined to think the best device might be a fastener prolonged by two or three hinged plates at each link, each holding a screw. They would be a nuisance to affix, but when once in position would run well, as a rubber belt is practically free from stretch, and in these days of adjustable pulleys a small degree of stretch does not require the shortening of the belt. A reader suggests that the belts should be moulded with a metal chain in the part of the core near each end, so that the screw could pull against the loop of a link in the chain, instead of against the material of the belt. This would distribute the strain without complicating the fastener, and nicks on the top of the belt could show the point at which screws should be inserted. One thing is plain—that these belts will not be perfect till a better joint is devised for them. Letter 3491 struck me as an excellent tip for applying to standard fasteners.

MOTOR BICYCLES FOR SALE.

HALIFAX.—400 motor cycles to select from: splendid value; cash, credit, or exchange.—Below.

HALIFAX.—£18 18s.; fine twin Rex, spring forks, R.O.M. ignition, blue lines, recommended.—Below.

HALIFAX.—£19 19s.; magneto Rex, 1908 model, single-cylinder, nearly new, and guaranteed.—Below.

HALIFAX.—28 guineas, cost 38.—1908 single-cylinder Rex, ball bearing engine, not used 10 miles, guaranteed perfect.—Below.

HALIFAX.—£3 down and 5s. weekly secures 3½ h.p. Rex, £10 10s.; 2 h.p. Simms magneto, £6 10s.; 2½ h.p. Kerry, £9 10s.; 2½ h.p. Excelsior, £9 10s.; 2 h.p. Humber, £7 10s.; 2 h.p. Minerva, £7 10s.; 1½ h.p. Minerva, spray, £5 10s.; 2½ h.p. Royal, £7 15s.; 2½ h.p. Clement, £9 10s.; 2½ h.p. Coventry Eagle, £9 10s.; 2½ h.p. Antoine, £9 10s.; delivery on first payment.—Halifax Motor Exchange, Westgate, Halifax.

2 h.p. Minerva, M.O.V., spray, girder forks, in perfect condition; photo; £10.—Bennett, Penwortham, Preston.

5 h.p. Twin Motor Cycle, fitted with Phelon and Moore two-speed gear; £24 10s.—Crabtree, Bridgend, Lancaster.

51 h.p. Twin Antoine, brand new; £30, or offers; must be sold this week.—Hardcastle, 77, Holme Lane, Sheffield.

31 h.p. Rex and Rigid Sidecar; £17 10s., or offer; will separate; trial allowed.—Morris, 477, Tong Moor Road, Bolton.

BARGAIN.—3 h.p. Minerva, splendid condition; only £11; must be sold.—Box 37, The Motor Cycle Offices, Coventry.

1908 3½ h.p. Minerva, spring forks, nearly new, climb a mountain, illness cause of selling; £27.—Duguid, Kirkby Lonsdale.

7-8 h.p. Minerva, accumulator, for less power, magneto, free engine.—Specification to Mudd, Cottingham, near Beverley.

23 h.p. Phelon and Moore, two-speed gear, accumulator, in fine condition, faultless; 25 guineas.—364, Manchester Road Bradford.

41 h.p. Minerva, 1907, twin, in perfect running order, B.B. carburetter, tyres excellent; £20.—Mitchell, 457, Lord Street, Southport.

MOTO-REVE, 1908, almost new, tyres barely scratched, horn, stand, carrier, spares, all as new; £32.—Davies, 185, Urmston Lane, Stretford, Lancs.

BROWN, 3½ h.p., very low, extra long wheelbase; bargain, nearest offer, £17, cash only.—J. Holland, 43, Ellor Street, Salford, Lancashire.

7-8 h.p. Minerva, new last August, too powerful, for 3½ h.p. 1908 Modele de Luxe Rex, two speeds, handle-bar control.—Hirst, Broomfield House, Batley.

21 h.p. Humber; £6, or offers, for quick sale; only requires cleaning; been stored away six months (tyres new).—26, Offerton Lane, Stockport.

5 h.p. Vindec, twin, Peugeot engine, two-speed gear, large quantity spares, perfect order; price £40.—Baxter, Waratah, Lower Walton, Warrington.

1907 Triumph, splendid condition, 3½ h.p., magneto ignition, spare tyre, belt, plugs, and valves; price £28, nett.—G. W. Mumby, Berkeley Street, Hull.

31 h.p. Quadrant Motor Cycle, spring forks, first-class hill-climber; £20, or exchange and cash for small car.—Carnforth Cycle and Motor Co., Carnforth.

41 h.p. Twin Minerva, magneto, spring forks, 2½in. tyres, butt-ends, perfect; £28, or exchange for good Triumph, or 4½ h.p. F.N.—315, Hessle Road, Hull.

31 h.p. Rex, 21in. frame, 26in. wheels, perfect order throughout, pump, stand, horn; £11, or best offer, a bargain.—Alfred Crampton, 103, Edinburgh Street, Goole.

WHAT Offers for one 1908 5 h.p. Twin Tourist Rex, one 3½ h.p. 1908 ball bearing Tourist Rex, as delivered from the makers.—Tidswell Preston Street, Bradford.

1908 (September) F.N., 4½ h.p., four-cylinder, only been short trial run; will accept £45, including full accessories.—Carter, St. Margaret's, Park Avenue, Harrogate.

BELT Rim Brakes, flexible cable hand applied, easily fitted, stop anything; 8s. 6d., usual price 15s.—Slack's Garage, Stockport.

YOU KNOW THAT

The ability to drive slowly is as important as the ability to drive fast. Now **WHITE'S ECONOMISER** enables you to keep going steadily at a walking pace, without misfiring. It enables you to throttle down to the extreme, and ensures an instant start at all times, in all weathers, without flooding Carburettor and without opening throttle more than for normal running. It therefore saves your petrol, and has, in fact, won first prize in recent consumption tests. It can be attached in half a minute to models E and H Longuemare, Rex, and Minerva-Longuemare, and /o8 Triumph Carburettors. Try one—it is so simple, and its price is only 4/-.

THE "ELECTARY" ADJUSTABLE FOCUS PROJECTOR, with GENERATOR (The finest motor cycle Searchlight extant), 30/-

PULLEYS for any motor.—De Dion, M.M.C., 6s. 6d.; Antoine, N.S.U., Kelecom, Roc, F.N., 5s. 9d.; Peugeot, Brown, 5s. 6d.; Triumph, Fafair, Sarolea, Minerva, 4s. 9d.; plated, guaranteed, carriage paid.—J. Perkins, High Road, Leyton, London.

31 h.p. Engine, running order, frame, tanks, saddle, exhaust, Longuemare spray, 26in. wheels, £2 5s.; pair 28 by 2 wheels, belt rim, 5s.; one 28 by 2 Continental cover, perfect condition, 5s.; £2 10s. lot.—4, Westbeach Road, Noel Park, London.

LONGUEMARE Carburetter, suit 3 h.p., two 24in. wired covers, ¼ h.p. electric motor, General Electric Co. make, 1700 revolutions, 100 volts, would drive lathe, gent's Enfield push bike; exchange good make magneto, motor clothing. — Kloth, hair-dresser, Manor Park, E.

"I WRITE to tell you I am delighted with the lens. It makes motoring at night equal to daylight." Why not you try one? Plano-convex lenses, 3in., 3½in., 3¾in., 1s. 9d.; 3¾in., 2s.; 4in., 2s. 6d.; 4½in., 2s. 9d.; 4¾in., 3s.; 4¾in., 3s. 6d.; 5in., 4s. each.—Payne, Metchley Lane, Harborne.

ACCUMULATOR, needs slight repair, 1s. 6d.; Minerva plain coil, perfect, 6s.; Main-Hilton carrier-stand, 2s. 6d.; long motor handle-bar and grips, ¾in. stem, plating perfect, 2s. 9d.; P. and H. tail lamp, nearly new, 6s. 6d.; Brooks B90 saddle, 4s.—Harding, Halberton, Tiverton, Devon.

16 h.p. Twin-cylinder Engine, will run on gas, petrol, or paraffin, complete with Longuemare carburetter, coils, accumulator, petrol and paraffin tanks, etc., very powerful; can be seen at work by appointment; price, complete, £25, or exchange 1908 Triumph.—T. Harris, 41, Albert Road, Stratford, E.

5,000 Government Gauntlet Gloves, 2s. 6d. pair; 500 leather belts, 1s. and 1s. 3d. each; leather leggings, 2s. 6d. and 3s. 6d. pair; Bedford cord riding breeches, 4s. 6d. and 5s. 6d.; Government all-wool military socks, 10d. pair; police capes, 4s. 6d. and 5s. 6d. each.—Anscumb, Government Contractor, 14, London Road, London, S.E.

FOR Sunshine and Showers.—The Albany waterproof jackets, in double texture paramatta, in fawn, also new grey-green, wind and rainproof, stock lengths 38in. and 40in., chest measures, 36, 38, 40, and 42, with storm cuffs, new collar, with attached flap. We guarantee every jacket, price 15s.; extra heavy at 18s. 6d.; send length desired and chest measure; overalls at 7s. 6d. and 8s. 6d. We pay carriage.—G. Raws and Sons, Indiarrubber Manufacturers, The Albany, Oldhall Street, Liverpool.

BELTS, genuine Lycett leather, two pieces, ¾in., 7s. 6d.; ¾in., 8s. 6d.; ¾in., 10s. 6d.; 1in., 15s., with fasteners, there's nothing like leather; B. and B. carburetter, brand new, 19s. 6d.; Rex, 3½ h.p., 1907 pattern, 15s.; Garrard two-speed gear, complete, fit Ariel, £2; several Garrard pulleys, 2s. 6d. each; large horn for dashboard, 7s. 6d.; G.B. vulcaniser, nearly new, cost 50s., accept 30s.; Rex 1905 front brake, complete, 3s. 6d.; plugs, 6d.; and other bargains.—Woodgate, 486, Coventry Road, Small Heath, Birmingham.

STAMFORD HILL.—40 amp. Peto and Radford accumulators, new, 16s. 6d.; Michelin tyres, 25-2, 18s.; 25-2½, 20s.; 26-2½, 26s.; Michelin butted tubes, 2, 2½, 10s. 6d., 11s., 12s.; leather D.B. jackets (new), 10s. 6d.; two-speed and reverse gearbox, 37s. 6d.; motor cycle tanks from 6s. 6d. each; 28 by 2½, 21s.; splendid V belting, from 8d. foot; carburetters, Longuemare H., 18s. 6d.; 3½ h.p. spray, 12s. 6d.; 2 h.p. ditto, 9s. 6d.; 3½ h.p. Whitley, 13s. 6d.; twin Kerry, 16s.; Midget plain coils, twins, 10s. 6d.; single, 6s. 6d.; 2½ h.p. Rex engine, £3 18s.; Clincher inner tubes, 6s. 6d. each; latest motor cycle searchlight, new, complete, 25s.; 4in. steel mudguards, 1s. 9d. pair; tri-car wing mudguards, 6s. 6d. pair; very large, 9s. pair; long handle-bars, dropped ends, 7s. 6d.; over-back seat-pillars, best plating, 4s.; list just ready, free.—128, High Road, Tottenham.

The Rich Detachable Air Tube Co.,
Patentees, CRAWLEY, Sussex.

Invaluable to Motor Cyclists when Touring or Planning a Tour.

"The Autocar" Folding Map, Style 3.....

"The Autocar" Folding Map occupies but little space on the motor cycle, as when folded up, in its case, it only measures 7½ x 9½ in. It is well printed on strong linen, all the main roads are marked in red and the distances between all important towns are shown.

Price 8/10 carr. paid

from the offices of
"THE MOTOR CYCLE,"
20, Tudor Street, London, E.C.

MISCELLANEOUS.

ONE 28 by 2 Beaded Edge Cover, Clinche pattern, quite new, 12s.; one Brook pau seat, almost new, £1; Millennium tri-car jack, 7s. 6d.; Guenet two-cylinder trembler coil and switch (two-way), in perfect order, £1 1s.; one brass Python horn, complete, with four feet flexible tube, bulb, etc., quite new, £1 5s.; one 3½ h.p. Minerva pulley, 4½in., new, 4s.; any of above sent carriage free on receipt of P.O.—Motor Works, Liphook, Hants.

PALMER Cord Cover, 28 by 2, beaded, wants repairing, 9s. 6d.; two Dunlop inner tubes, 26 by 2, wants repairing, 2s. each; pair 28 by 2 plated wheels (beaded), nearly new, with G. and H. coaster hub, 25s.; pair 28 by 2 wheels (wired), 10s.; Chapman's two-speed gear, complete with rim, etc., offers pair 26 by 2 Dunlop covers, good order, 9s. 6d. each; Chater No. 5 tank, with three ratchets, and oil pump, 10s.; Enfield tank, 2s. 6d.—Taylor's Motor Works, Edmonton.

BARGAINS.—Watawata belt, 7ft. 6in. b ¾in., 7s. 6d.; two Nilmelior tremble coils (circular vulcanite cases), good order, 11s. each; spring saddle pillar, ¾in., 5s. 6d.; Minerva 3½ h.p. valve, new, 3s. 6d.; motor cycle frame (Chater), 15s., sound; also offered for 28in. by 2in. wheels (front and rear, with belt rim) and tyres in good condition, Bowden back rim brake, handle bars, pedals, chain wheels, cranks, etc. Humber large free wheel, and small ditto. Motorist, 7, Evington Street, Leicester.

TRADE ADVERTISEMENTS.

LOOK—Adjustable pulleys, 4½in., 8s.; 5in., 9s.—Lee, engineer, 18, Somerset Road, Edmonton.

N.S.U. Two-speed Gear and Free Engine. We can now fit this gear to Peugeot and Vindec machines for £5 15s.; recommended for side-car work and winter riding.—Eagle and Co., N.S.U. Agency, Acton. Telephone 556, Chiswick.

WHO would have solid value for hard cash will at once write p.c. for June motor cycle and cycle accessories list, 2 illustrated pages; lowest prices in the trade; all latest novelties in lamps, swan neck seat pins, long handle-bars, footrest, free engine pulleys, spring forks, belt tyres, covers, etc.—Metropolitan Machinist Co., Ltd., M.C. Dept., 75, Bishopsgate Street Without, London, E.C.

TWENTIETH Century Motor Co., Ltd. Padua Road, Penge, S.E.—Carburetter new, from 8s.; control levers, new, from 1 3d.; oil pumps, new, 3s. 3d.; circulating pumps, new, 15s.; distribution wheels, new, 4s. per pair; trembling coils, from 7s. 6d.; Guenet twin trembling coil, 12s.; two-way handle-bar switches, new, 1s. 6d.; piston ring, and pulley castings; approval through The Motor Cycle, or on receipt of cash; Humber motor bicycle, £5 10s.; send stamp for list of other goods.

Comfort & Safety

are ensured by the

DRUID SPRING FORK

Have you ever considered the risk you run if your forks are not strong enough, and what happens when forks break?

Why risk an accident when the DRUID SPRING FORK would ensure your safety and increase the pleasure and comfort of riding.

Let us send you particulars.

A. DREW,
Conybere St., BIRMINGHAM.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

Which is the Best Sidecar?

By B. H. DAVIES.

I DO not personally believe there is a plain and unqualified answer to the question of my title, since, as sidecars are theoretically stupid and unmechanical attachments, each has some bad points in actual riding practice. The question is further complicated by the fact that each type of sidecar has advantages of its own as compared with any other, and these separate drawbacks and advantages are bound to appeal with varying force to riders of different types and temperaments. However, the silly season of motor cycling is fast approaching, when about half of our number will lay their machines aside for the winter, and begin to spout columns of infuriated opinion on various questions connected with the pastime, so here is an admirable topic of discussion ready made to our hand. A very interesting letter received some months ago from R. G. Booth, of the M.C.C., has led me to make a start in it. My own answer to the question I propound is curious indeed, since of the four types of sidecar I have driven the one which I on the whole prefer to the rest is no longer made.

The Rigid Sidecar.

The special advantage of the rigid type is that it never under any circumstances side-slips, and this is certainly a point of huge weight. Its steering almost coincides with that of the De Dion tricycle, and the sole point where care is required is when returning off the camber of the road on to the crown in a hurry; jerky steering under these circumstances sometimes makes the front wheel hop, and it then loses its direct-

ing power, and allows the machine to remain down on the camber, or even to continue in its former direction and to go towards the ditch.

The only two real drawbacks of the rigid type of sidecar are that the passenger is carried too far back for real sociability, for if the chair be moved forward there is too much overhanging weight, and that the machine is rather dangerous to drive without a passenger, while detachment and attachment are rather lengthy processes.

The Flexible Type.

The flexible type possesses two great special advantages. One is that the steering is practically identical with the steering of a bicycle, and the other is that the sidecar can be whipped on and off in a few minutes or safely ridden with the chair empty. It does not side-slip appreciably if studded tyres be employed, and it is claimed that a fitting is now incorporated in it which prevents sideslip with smooth tyres, but as I have only ridden with this fitting for two hundred miles I am not qualified to pronounce upon that point. With this type of sidecar the bicycle is never ridden strictly vertical, but has to be allowed to slope away a trifle from the sidecar. This is a defect in sudden alterations of steering on very highly cambered roads. For instance, one meets a cart on a highly cambered lane, and has to go down the camber towards the left-hand ditch, to give it room; the sharp turn thus required compels the driver to let his bicycle lean over towards the sidecar. As soon as he has got down the camber he has to pull

his machine over away from the sidecar again to keep the combination vertical. If there is another cart down on the camber just in front he has to wrench the bicycle over violently to get off the camber again, and pass this cart by descending to the other camber, *i.e.*, that on the right. Some strength, address, and confidence are needed for accurate steering under these circumstances. Again, very sharp turns towards the side on which the car is fitted are difficult to make, because the presence of the car on that side limits the amount to which the driver can "lie over" towards that side, and if he is not careful his thigh may get nipped gently between the tank and the sidecar. On really good roads this sidecar is delightful to handle; on very twisty and highly cambered roads it requires some practice to make the driver really comfortable.

The Castor Wheel Type.

The castor wheel type is a very excellent device indeed. Its wheel is well forward, and puts the passenger in the most sociable position imaginable, while the steering with the car laden is perfect, and allows very sharp turns to be taken at a high speed without discomfort or danger—in fact, taking into consideration both good and bad roads, cambered and flat surfaces, low and high speeds, I should give this form of sidecar a pre-eminent place on steering grounds. I rode it for the first time with the chair empty, which is a point in its favour. It is far less easy to attach and detach than the flexible type so far as the time occupied is concerned, but there is no difficulty in its adjustment—it is simply a matter of attaching joints, not of finding the correct position, as one has only to see that the sidecar is vertical. On the other hand, it is no preventive of side-slip. The sidecar wheel merely trails, and if either wheel of the bicycle skids the sidecar wheel obediently trails after it. It is of advantage in mild skids, since it prevents the bicycle from lying down. It might render a very bad skid worse, and accentuate it. In riding practice I have had no skidding troubles while using an armoured tread on the rear tyre of the bicycle; this precaution I have found to reduce all skids to that mild order where the divergence from track is not serious, and the presence of the sidecar prevents the bicycle from lying down. I should like to see one point in its design altered, though I may

be hypercritical. The sidecar wheel is carried in double forks of V shape. But there is only one single lug to take the whole of the weight and leverage at the point where the sidecar is joined to the vertical column to which these double V forks are attached. I should think that in prolonged usage there must be some slight fear of a breakage at this point. Otherwise if used in conjunction with a studded tread I do not see what disadvantages can be urged against this type of sidecar.

The Duplex Steering Sidecar.

I believe I am right in saying my very first experience of driving a sidecar was with one of Mills and Fulford's old side steering pattern, in which a steering bar coupled the sidecar wheel to the steering wheel of the bicycle. This type for some hidden reason is now missing from the market, but R. G. Booth and myself concur in claiming for it the following advantages:

1. No side-slip whatsoever, even with plain tyres.
2. Perfect sociability.
3. Takes any corner safely at speed, to right or left.
4. Will always come up on to the crown of the road off the camber quite obediently.
5. A minimum of side pull, hence minimum of power required to pull it.
6. Safe to ride solus, or easily driven from chair.

Two points only count against it—that it is more costly to make than the simpler patterns, and that the correct adjustment takes some finding. When found, the side tyre will run thousands of miles; until found, the side tyre will wear out in 500 miles.

In conclusion, I notice one very bad point about practically every sidecar combination I have ridden, and that is the weakness of the brakes. As I go everywhere, and hate any anxiety about hill-climbing, I confine myself to a chain drive and two-speed gear for sidecar work; and I had never arrived at a combination of this type with efficient brakes until I got the Advance Co. to work out a hint given in *The Motor Cycle* for me, and fit a special belt rim solely for braking purposes on the opposite side of the rear wheel to the sprocket. I had previously tried every other type of brake, including rim and band patterns, and had never felt or been safe for long at a time. This belt rim brake is immensely powerful, and remains so for indefinite periods.

"THE AUTOCAR" LECTURES.

THE series of weekly lectures on the motor car which have been organised by *The Autocar* throughout the country commenced at the London centre on Tuesday, October 13th, in the small hall of the Queen's Hall, Langham Place, W. The complete list of dates at the various centres is as follows:

LONDON.—Queen's (Small) Hall, Langham Place, W. Tuesdays, October 27th; November 3rd, 10th, 17th, 24th; and December 1st, at 3.30 p.m. and 8.30 p.m. (tickets available for either afternoon or evening).

BIRMINGHAM.—The University, Edmund Street, at 7.30 p.m. Wednesdays, October 21st, 28th; November 4th, 11th, 18th, 25th; and December 2nd and 9th.

LEEDS.—The University, College Road, at 7.30 p.m. Thursdays, October 22nd, 29th; November 5th, 12th, 19th, 26th; December 3rd and 10th.

MANCHESTER.—Geographical Institute, The Parsonage, Deansgate. Fridays, October 23rd, 30th; November 6th, 13th, 20th, 27th; December 4th and 11th, at 4 p.m. and 7.30 p.m.

NEWCASTLE-ON-TYNE.—The Armstrong College. Mondays, October 26th; November 2nd, 9th, 16th, 23rd, 30th; December 7th and 14th.

There will be a discussion after each lecture, and the lecturers will deal with any special points desired by those who attend. We cannot too strongly urge our readers not to miss the opportunity these lectures offer for the obtaining of a sound practical knowledge of motor matters. They will prove of especial value to motor cyclists who hope one day to be car owners, and also to riders who have no intention of taking up the costlier vehicle.

The lectures are an educational effort on the part of *The Autocar*, and the fee (£1 1s. for the course) is fixed as low as possible. Affiliated members of the M.U. may obtain tickets for the course at 12s. 6d. each. Applications for tickets should be made immediately to the Lecture Secretary, *The Autocar*, 20, Tudor Street, London, E.C.

ACCESSORIES.

A FEW OF THE LATEST ACCESSORIES FOR MOTOR CYCLES.

Among the numerous motor cycle accessories marketed by J. B. BROOKS AND CO., LTD., Great Charles Street, Birmingham, is the toolbag No. 9,367. This is a bag with rearward extension specially designed to utilise the space which exists between the coil springs of the Broo and Bro5 Brooks saddles. In this manner a separate compartment is provided fitted with pockets for spares. It is almost superfluous to add that the bag is constructed of best quality leather, hand sewn, as all Messrs. Brooks's saddles and bags can be relied upon to be of good quality. As shown in the illustration, the bag has a gusseted fall front, large pocket, loops for repair outfit and oilcans, a small loose bag for sundries, and an outside pocket for a paraffin tin.

A useful toolbag made by J. B. Brooks & Co., Ltd.

Handle-bar control is now so firmly established in public favour that few motor cycles will be found at the approaching show not fitted with this control in one form or another. The pioneer firm in connection with this improvement is undoubtedly the E. M. BOWDEN'S PATENTS SYNDICATE, LTD., Baldwin's Gardens, Gray's Inn Road, London, W.C., who have persistently advocated its advantages for several years, and whose system with minor modifications is so largely in vogue. The latest form of the Bowden handle-bar control—a new introduction for 1909—is particularly neat, as will be seen by the accompanying illustration. This shows a neat pair of all-metal levers arranged on a single stud, commonly used for operating the gas and air valves or slides of the carburetter. The under lever measures $3\frac{7}{8}$ in., and the top one 3 in., from centre to tip in each case, the drum portion being $1\frac{1}{4}$ in. in diameter. Either lever will give a pull of 2 in., and each is independent, that is to say, either can be moved without altering the position of the other, and they will hold their position against vibration or the pull of a strong spring. They are made for both right and left-hand, and can be had with a clip to suit any diameter of bar, or with a circular plate for attaching to woodwork.

A new Bowden Patent Handle-bar Control.

Champions of the rubber and canvas belt will be interested to hear that the HANOVER RUBBER CO., 29-31, Old Street, E.C., makers of the Shamrock-Gloria belts, have introduced a $1\frac{1}{8}$ in. size for high powered machines and for use with sidecars and tricars. These belts are being made under a process

which ensures the correct position of the canvas core and an equal distribution of indiarubber at the sides. It is worthy of note that J. Marshall used one of these belts in the Tourist Trophy Race, as did Gordon Gibson, the winner of the race at Brooklands on the 3rd inst., and C. R. Collier on his world's hour record.

W. W. GENN, 10, Wimbledon Park Parade, Gap Road, Wimbledon, has sent us particulars of a spring seat he has introduced for motor cycles, which can be fitted to most existing models. Reference to the illustration shows that

the ordinary seat-pillar is extended down, at the rear of the fixed seat tube. Connected to it are two pairs of shackle plates, one of which is connected to a coil spring arrangement which allows a certain amount of rise and fall of the frame and wheels beneath the rider without affecting his horizontal position. It is claimed that this spring seat-pillar absorbs all road shocks, and as it can be fitted without much trouble, there should be an extensive demand for it.

W. W. Genn's Spring Seat-pillar.

Whatever our readers opinions may be with regard to the tambourine road clearers there is no question of doubt that they are effective. The one sold by LEO RIPAULT AND CO., 64a, Poland Street, Oxford Street, London, W., must not be confused with the parchment affairs used on pedal bicycles. For motor cycling the "Tambourong" has been introduced. This is made of metal, and is the subject matter of letters patent which Messrs. Ripault inform us they believe to be prior to any other.

THE UNITED MOTOR INDUSTRIES, LTD., 45-46, Poland Street, E., have a new line in tool rolls for motor cycle tool cases, which we illustrate. The roll, which we have examined, contains most excellent implements well adapted to the use of motor cyclists.

A useful tool roll sold by the United Motor Industries.

There are two adjustable spanners (one large and one small), combined pliers and wire cutters, pipe grips, engine spanner, steel punch, screwdriver, file, and last, but not least, a belt punch. At one end is a

Accessories.—

pouch for very small files or other articles which might be carried, also license if so desired. It is made of black leather, with stout buckle, and is sold at a reasonable figure.

HUNT'S STORES, 104, Newgate Street, E.C., have laid themselves out specially for dealing in motor cycle accessories, and have in their excellent catalogue a number of articles which are of interest to readers. First and foremost is a small tool roll (which we illustrate), containing gas and cutting pliers, spanner, and turnscrew. It does not take the place of the tool rolls which contain a more multitudinous array of implements, but it is nevertheless a handy little wallet, particularly for those riders who do not wish to encumber themselves with too much weight.

A fibre-faced hammer is another article which will appeal to those readers who take pride in making their own adjustments and running repairs. Nickel plated nuts, bolts, and other parts are very often damaged by blows with an ordinary steel-faced hammer, and the fibre-

A small Tool Roll sold by Hunt's Stores.

faced hammer has been introduced to prevent this. It is really a most useful tool, and quite supersedes the old style copper-faced hammers for similar work. In lamp brackets a new model has been introduced which can be attached to the crosspiece of a handle-bar, and will be found useful for carrying an extra lamp or even a generator.

An exceedingly useful accessory has been brought out by the Novdel Co., 92, Bexley Road, Northumberland Heath, Belvedere. This consists of a carbide container and matchbox, an illustration of which accompanies this description. The whole device is small, compact, light, and thoroughly practical. It will be seen that it holds sufficient spare carbide to fill an ordinary lamp, and has also a spacious receptacle for wax vestas. It is provided with a roughened portion on which to strike matches on one side, and has a lighting up table on the other. The only point in which we can suggest an improvement is that the matchbox and carbide container ends should be marked to show to which they belong. The fact that

it can be carried on a pair of pump clips is an extremely important one, as it allows the container to be stowed

A neat and practical Carbide Carrier made by the Novdel Co.

away neatly and to be readily accessible when required. It is sold at quite a moderate price, and can be obtained in London from the Service Company, Ltd., 292, High Holborn, W.C.

THE PREMIER MOTOR Co., Aston Road, Birmingham, have sent us one of their latest road clearers—an electrically-operated horn—together with their stand and luggage carrier. The apparatus consists of an electric buzzer worked by a tiny dry battery, with wires and press button ready to attach to existing motor cycle horns, or the horn can be obtained complete. The great advantage of an electrically-operated horn is that it can be operated without removing the hands from the handle-bar, and the note of warning continued as long as the press button is depressed. For those riders who employ battery

The Premier Electric Horn, with push-button for handle-bar. It can be worked with a dry battery.

ignition this will be found a useful accessory, as the buzzer can be connected to one of the accumulators without trouble. In the case of magneto-ignited machines, a special dry battery can be carried in a separate case. This should be as large as possible, as most electric horns are somewhat wasteful of current, and it is awkward to find the battery discharged.

(To be continued.)

OCCASIONAL COMMENTS.

By "IXION."

Some T.T. Jottings.

The T.T. Race brought out one point distinguishing the amateur from the trade rider, to wit, that a man will sometimes take risks in the interest of his profession which he will not take for sport. It is not necessarily the fastest machine that wins in the Isle of Man, but the best combination of machine and man. For instance, on the bottom of Glen Helen there is a nasty corner. Here all the riders with a single exception switched off their power for a few yards; the solitary exception, who kept his engine running, saved a good ten seconds on each of the ten circuits, quite apart from the time he gained through starting a climb with his engine already on the pull. Thus he snatched a two minutes advantage over all his rivals at this corner alone, and the name of the corners on the course was Legion.

The preliminaries and after proceedings were by no means devoid of fun. One rider imagined the regulation about efficient silencers was intended as a pious fraud on the public, and as the lower half of his silencer was invisible, thanks to its position, he drilled it out into a mass of holes held together by thin segments of metal, leaving the top half—against which no gases were deflected—deceitfully intact. It was rather a shaker for him to find that in a preliminary parade he was expected to flit past the judges at a high speed as noiselessly as possible on full throttle. However, he got up steam, and quietly snicked his handle-bar throttle shut as he neared the judges' stand, with the result that he was passed, and able to continue a Gatling gun-like progress in the actual race.

"The Deal was Off."

After the race, one of the riders had some fun with a group of dust-begrimed riders, who attacked him on the ground that his machine was not standard. Of course it was not standard—the regulations did not require that it should be. However, for the sake of peace, he bluffed them with an offer to sell it at catalogue price, after taking in his interlocutor's appearance, which did not bespeak great wealth. His tormentor promptly produced a sheaf of notes, and it was amusing to see the rider drag the man of means aside and earnestly whisper, "Look here, old man, you may have this machine if you like, but I wouldn't if I were you. I've raced it to death since I've been over here. The bearings are all worn and the piston's cracked. You wouldn't like it; you wouldn't really!" The "deal" was off!

Small Engine Pulleys.

From time to time I receive enquiries for advice respecting machines with very small engine pulleys fitted to engines of extremely low power. The entire efficiency of these machines depends first and foremost on a suitable belt. Solid belts, whether rubber or leather, which give entire satisfaction on ordinary types of mount with 4in. or 5in. pulleys will crack up in the most heart-breaking fashion on a 3in. pulley. The only belts calculated to give decent results on these tiny pulleys are those which attain flexibility not only by material, but by design. A case in point was the 2 h.p. New Hudson motor

bicycle introduced about 1903, if my memory serves me rightly. It was fitted with a beautiful little engine made by the De Dion people, but it only sold in small numbers, and the New Hudson Co. abandoned the motor cycle trade in consequence. The sole serious defect of these machines was belt-slip, due to the use of solid belts on a tiny pulley. One friend of mine bought one of these machines, attracted by the merits of the engine, and, in spite of frequent belt troubles, was dogged enough to keep it till the days of the Watawata belt. He soon discovered that the fitting of a belt which attained flexibility by design as well as by material transformed his quondam aggravating little jigger into a most reliable steed. There are a number of riders suffering in a similar manner to-day. I think all of them would find trouble ended if they purchased any of the belts constructed on a flexible system, prominent amongst which stands the Watawata type. Personally, I refuse to employ any solid belt on a lightweight.

The Knight Engine.

Several friends have asked me which motor cycle firm has obtained the license of the revolutionary Knight engine adopted by the Daimler Co. for their 1909 cars. I am unable to hear that Mr. Knight has yet granted a licence to any motor cycle manufacturer in any country. It seems to me rather doubtful whether any manufacturer will care to fit this engine to a motor cycle. The absence of water cooling alone will make a great difference to its efficiency, or so I should opine as a matter of theory, and, further, it will require very exact lubrication, and, knowing the eccentricities of many motor cyclists in that respect, it is doubtful whether an already successful maker would dare to fit it. At any rate, there will be no hurry about it, though I certainly hope we may eventually see this type of engine on motor bicycles. For the benefit of readers who have not seen the drawings of it in *The Autocar* I may add that the innovation on this engine is the substitution of slide valves for the ordinary poppet or mushroom-headed type. There is no valve box, but ports for the inlet and exhaust are cut in the walls of the cylinder, and are opened and closed at the proper moments by two concentric cylindrical sleeves fitting inside the main cylinder. The piston slides within the interior sleeve, and does not touch the wall of the main cylinder at all. These sliding sleeves are operated by short connecting rods, extending from eccentrics on the camshaft to brackets cast on the lower rim of each sleeve. Lubrication is maintained by splash from the crank case, capillary action, aided by spiral grooves in the surface of the sleeves, keeping a constant film of lubricant between the cylinder and sleeve No. 1, between sleeves No. 1 and No. 2, and finally between sleeve No. 2 and the piston. Three main claims are made for the engine, viz., greater power than can be got out of the same cubical capacity when poppet valves are used, greater flexibility, and greater silence.

When C. R. Collier broke the world's motor cycle record by covering 70 miles 105 yards in the hour, he used Pratt's motor spirit.

MOTOR CYCLE LAMPS.

(Concluded from page 800.)

WORSNOP AND Co., The Carlton Lamp Works, Halifax, are the manufacturers of the Fifax petroleum motor cycle lamp, which provides a novel system

Worsnop's Acetyloid Headlamp with separate generator.

of illuminating the numbers. It will be noticed on reference to the illustration that the lamp is provided with a back glass and a double number plate arranged in the form of the letter A. The apex of the letter A divides the back light into two streams, which illuminate the registration numbers and letters painted on the one side of each plate. The lamp burns paraffin oil, and is provided with a round wick and glass chimney, the latter being held upright by means of a special spring wire attachment which passes through the top of a detachable cowl provided with

a bayonet joint. These lamps, it is claimed, give ten times the light of the ordinary oil lamp, being fitted with a scientifically constructed burner with a proper wind-up arrangement for the round wick. Provided the lamp glass will stand the vibration on a motor cycle, we see no reason why these paraffin lamps should not be successful, although we

Worsnop's "Fifax" Paraffin Headlight with number plates.

must admit that we have not tried one ourselves. It certainly has advantages in the shape of simplicity and cheapness of fuel. We hope to give one of these lamps a trial very shortly, and if it comes up to our expectations we shall have something further to say

about it. In addition to the above petroleum lamp, Messrs. Worsnop and Co. make an acetylene gas lamp with separate generator. The lamp is fitted with a silvered reflector, stout lens, and is well finished in polished brass. It can also be supplied with the body of the lamp shaped on the lines of the Rushmore with mirror lens. Customers are given a choice of generators, viz., diving bell, percolator, and drip feed system. The lamp is provided with a tap for shutting off the gas when not required, and it goes by the name of the Acetyloid gas lamp.

ANDRE GODIN, 1, Red Lion Square, W.C. The above firm does not make a speciality of motor cycle

A new headlight sold by Andre Godin.

lamps, but sells a small car lamp with separate generator which would serve admirably on a tricar. The lamp is well made, and should give a good light. Two distinct different kinds of generators are supplied, so that a purchaser can select whichever of the two he prefers. One is on the drip feed system, while the other works on the diving bell principle.

THE PREMIER MOTOR Co., LTD., Aston Road, Birmingham, have had their Premier searchlight

before motor cyclists since last winter. This lamp and generator are British made, constructed of brass throughout, and finished in polished brass or nickel plated. A mirror lens curved to the correct angle projects the light 200 feet ahead. After a careful examination of the Premier searchlight we are of the opinion that it is equal to anything of the kind sold for motor cyclists' use. There is nothing flimsy about it, and, while being strongly and substantially made, it is not particularly heavy. The dimensions of this lamp are: Height over all, 6½ in.; length, 5¼ in.; diameter of face, 4¾ in. The front glass is dissected, and where it fits into the frame of the door it is packed with some soft material to prevent rattling of the

Premier Searchlight, with separate generator.

Motor Cycle Lamps.—

glasses. From personal observations we have proved that this lamp gives an excellent light, projecting in one circle a long distance ahead of the machine without causing dangerous and objectionable glare at close quarters. The generator, which is of the ordinary drip feed pattern, can be attached to any fork, and when fully charged gives five hours' continuous light. One of the special advantages offered by the company is a three days' trial of this lamp.

The name of C. A. VANDERVELL AND CO. is obviously associated with electric lamps, two patterns of which we illustrate. The head light for motor cycles is called the Model C, and is fitted with the new four-volt C.A.V. metallic filament bulb, manufactured especially for them by Edison and Swan. This lamp gives an extremely brilliant light, carrying its rays a considerable distance with a current consumption said to be as low as .56. The Model D electric lamps are for side lights on tricars, and are provided with a side red light so that it shows a red warning light to the rear as well as on both sides of the machine. This lamp is also fitted with the same bulb as the Model C, and, in addition, the Model C head light can be supplied in pairs for tricars when a particularly brilliant light is desired. Suitable accumulators, put up in any style or shape, are supplied according to the desires of the purchaser. The address of C. A. Vandervell and Co. is Warple Way, Acton Vale, London, W.

The X-Ralite headlight and generator is a two-unit lamp sold by the PERCY CYCLE Co., LTD., St. Andrew's

X-Ralite Headlight (with bull's-eye lens) and Generator.

Place, Northumberland Street, Newcastle-on-Tyne. The lamp is light in weight and fairly strong. The lens is carried on a wire frame, and is placed very close to the burner inside the lamp, the front being protected by the usual glass, which is about 4½ in. in diameter. As will be noticed, the door is fitted with a double hood, the top extending a little further forward than the bottom. The burner socket is provided with a small shut-off tap, and the bracket at the back will fit practically any lamp iron, and is provided with a thumb-screw and lock-nut adjustment. A good point about the generator is that it has a patent cleaning needle for the water drip. This is a handy device, for, as users know, the valve occasionally becomes choked.

The question of producing a good motor cycle lamp has not escaped the notice of MESSRS. A. DUNHILL, LTD., Euston Road, as they have a very complete assortment of headlights. Three of these are designed

for motor cycles. One is a lamp fitted with a combined generator and a specially strong bracket; the second is a lamp with a separate generator designed to fit on the forks of the machine; while the third is a well-constructed lens mirror headlight of a type which has become popular of late. This lamp, which has a separate generator, is known as the "Hella." The last of the series is a set of two tricar lamps supplied by one generator, capable of generating gas for six or eight hours. These lamps are well made, and have a special internal reflector designed to project the rays of light on the principle of the condenser lens largely used by many lamp makers.

C.A.V. Model D Electric Sidelight for tricars, with red light shining partly to the rear.

C.A.V. Model C Electric Headlight, fitted with the new four-volt C.A.V. metallic filament bulb.

An article on motor cycle lamps would be incomplete without a description of the latest Frank motor cycle headlight with separate generator. All the latest

Frank lamps are provided with bull's-eye lenses fitted in the centre of the ordinary front glass. The projector is of polished aluminium, and the general finish and outline of the lamp is very handsome. The particular one illustrated is fitted with a bail handle of stout dimensions and an adjustable back bracket, which is quite the best type used on motor cycle lamps. Provided the lamp iron does not exceed 1½ in. across, the bracket will fit all thicknesses of lamp irons from ¼ in. downwards.

The bracket for attaching generator to the forks is substantially made, and if the clip is carefully screwed up the generator cannot jump off, although the bracket is liable to slip. Mr. E. J. HARDY, Bishop Street, Coventry, is the wholesale agent for Frank lamps.

The latest Frank Tricar Gas Lamp, with bull's-eye lens and separate generator. The bicycle size is slightly smaller, and has no bail handle.

Motor Cycle Lamps.—

J. C. FULLER AND SONS, Woodland Works, Wick Lane, Bow, London, E., have sent us a sample of their motor cycle electric headlight. This lamp is provided with a duplex lens, and is made on substantial lines, similar to the motor car electric headlight which is manufactured by the same firm. It has a green glass on one side and a red glass on the other. The lamp bracket is supplied suitable for fitting the standard Lucas and other lamp irons.

The Fuller Electric Headlight showing the bull's-eye lens.

A COMPLETELY PROTECTED MACHINE.

THE following particulars are of an improvement just patented by Mr. John A. Miller, Brentwood, Brighouse, Yorks., having as its object the keeping of rider and engine dry and clean in wet weather. The patentee says:

"I tried several plans, but got very little satisfaction from large front flaps and mudguards arranged with

trated in the annexed photographs, embodying complete protection for the feet, knees, engine, and magneto combined with a wind scoop for the cylinder. The shield is, of course, readily detachable.

"I rode from Huddersfield to Glasgow, Edinburgh, and back, through four days' rain, on September 20th, 23rd, and this fully satisfied me that dirty weather riding can be made much more comfortable, as during the four days I had not a wet boot or sock, although I discarded the general clothing equipment for touring. Nor at the end of any day's run was I unpresentable through mud, and, finally, I had not one stop through the interruption of the spark, although many of the roads were swimming in water, and I rode during some very heavy falls of rain, when even carters on the roads left their carts to seek shelter. Although I received the congratulations of many motor cyclists, some thought it would cause too much wind resistance, but as the guard is only the same width across as the rider's body while sitting in the usual easy position I think it will be seen that for any purpose, excepting perhaps racing, any little extra resistance is negligible; at least I found it so with my weight of 15 stones, including luggage.

"An angle-shaped guard, not shown, fitted around the belt circumference, and outside the main guard completes the protection of the rider and engine. Thus equipped one feels a pride in travelling at an even pace, indifferent to the filthy condition of the roads, knowing that one will arrive at one's journey's end in a clean state. Surely, too, the engine will be better

For winter riding on very muddy roads, something more than the ordinary mudguards are required, and the above is a praiseworthy effort by J. A. Miller to keep engine and rider clean. The arrangement is described on this page.

sides carried well round the wheels, as once put forward by a contributor in *The Motor Cycle* for a winter machine.

"Again, when caught in very heavy rainfalls, apart from getting into an awful mess, my machine would stop on account of the water on the high tension terminal and the magneto plug, which would then require wiping with a dry cloth. This trouble would sometimes arise, too, from running through big puddles of water at even slow speed.

"Setting to work again in another endeavour to do away with the disadvantages of winter riding, I at last hit upon the idea of a shield and undershield, as illus-

for the absence of what would otherwise cover it in the form of a grinding solution, free to penetrate the bearings, valve guides, etc.

"Features not to be overlooked are that the general accessibility and pedalling are in no way interfered with, and the pedals and the chain are not choked up with mud, as is usually the case."

Readers who wish to communicate with the makers of the Fit-all and Powell's hub two-speed gear, previously manufactured by the Burgess Eng. Co., Leicester, should note that the sole address is now A. D. Powell and Co., 3, Aylestone Street, Leicester.

LETTERS

THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

The Lubrication of Engines.

[3606.]—Referring to the lubrication of motor cycles mentioned recently in these pages, what objection would there be to fixing a second oil pump on the opposite side of the tank, to supply a sight feed lubricator for normal running, retaining the original pump for hill-climbing or low speed gear work where an extra amount of oil might be required?

W. E. S. M.

Motor Cycle Finish.

[3607.]—Having used Robbialac on my tricar, I can assure your readers that it is a complete success, and does not require stoving. I gave two coats of French grey, allowing thirty-six hours between each coat. The result is all that can be desired, the paint drying out perfectly hard and smooth and equal to the best stoved enamel. I think your correspondent who complained recently must have made some mistake in applying the composition. A flat varnish brush should be used, and great care taken to have the surface clean. Original enamel need not be removed. ID 23.

The Life of Pneumatic Tyres.

[3608.]—With reference to rubber studded tyres, can users of these beat the following: 2,235 miles on back wheel of machine weighing 224 lbs., rider 13½ stones, no punctures, bursts, damaged fabric, or side-slips? I accomplished this distance with a Brooks steel-studded tyre, and 132 miles of this with an additional 11½ stones passenger on carrier!

There has been some correspondence in your paper to the effect that one set of rubber studs will outlive two and even three steel-studded bands. If this be the case, the tyre problem is certainly solved once for all. It might be interesting to hear of a few comparisons with weights of machine and rider stated.

C. A. CROW.

The Efficiency of Dry Batteries.

[3609.]—With reference to the discussion in your paper about a year ago *re* the efficiency of dry batteries, I am now in a position to give exact figures as to the working of a Hellesen flash cell on my 3½ h.p. Minerva tricar, plain coil. I ran this cell for 1,688 miles, when it became completely exhausted. Up to the last five miles I had no misfiring, and could detect no falling off in power. However, as soon as misfiring began, the cell became very rapidly exhausted. This means that the battery in question fired my machine at full efficiency for 1,683 miles. I have had no ignition troubles since using these cells, now over three years.

T. E. CALLAGHAN.

Has the Tricar a Future?

[3610.]—With your permission I should like to say a word on this subject, my experience being 20,000 miles on a 3½ h.p. Phoenix Trimo, 1,000 miles on another tricar which shall be nameless, and 1,359 miles on my present machine—a 5½ h.p. Phoenix Trimo—which I mounted last August for the first time. I am exceedingly pleased with this machine, and have found very little adjustment has been required anywhere—high or low gear, clutch or chain. The chain of steering gear in my case gets a little dust, but no mud from the road. It has not at present required cleaning. The driving chains are all that could be desired, and good as new now, and never broken, or, so far as I can see, stretched. Any swing or whip of back seat has so far escaped my notice, and I am pleased to say it is a wonderful hill-climber with passenger, and luggage enough for a whole family for a fortnight. It is also most luxurious to ride, not

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

only on the crown of the road, but any part thereof, always provided it is driven at a pace suitable to the conditions of the road. I can drive on the greasiest of roads near the gutter with ease without non-skid, but I have to accommo-

date my pace to the condition of the road.

The springing of the back wheel is, in my opinion, a necessity, and I will never have another without. I intend this winter to have a non-skid fitted, not because I cannot run it without, but because it will allow me to travel quicker.

In my opinion the gear and clutch are perfect. The back wheel might, and in my case will, be made to remove with less trouble.

I will not further enlarge on the excellent qualities of this machine, but simply say I am satisfied.

ALFRED MEIGH.

[3611.]—Is it not possible for the makers to place a machine on the market similar to that shown in your issue of June 10th last, page 460? the only improvement being wheel instead of tiller steering, and perhaps a 5-6 h.p. engine. The objection chiefly raised to the present type of tricar is that of unsociability—one has sometimes to yell one's self hoarse to converse with the occupant of the front seat—not to mention the dislike of our lady friends at being perched out in front and meeting the oncoming traffic—cows, etc. A machine of the above type would be more comfortable for passenger and driver; the only questions arising are those of stability in grease, ease of rounding corners, etc. Perhaps the owner would give his experiences upon this point.

FJ 9.

[The machine in the issue quoted was a two-seated, side-by-side, double-driving tricycle, with tiller steering.—Ed.]

The Handicapping of Motor Cycle Races.

[3612.]—I was glad to see in last week's issue a letter from Mr. C. R. Collier on the handicapping of motor cycle races. The present system is anything but satisfactory. I have during the last seven years spent a considerable sum of money, not to mention valuable time, competing in motor cycle races and hill-climbs, and now, instead of reaping the benefit of my years of experience, I am put in return for my entry fee in a position where it is utterly impossible for me to win. At the Stadium on August 8th with an engine measuring 76 × 76 I gave 5s. start to an engine measuring 82 × 89 mm., 10s. start to one 82 × 90 mm., 10s. to one 84 × 86 mm., 15s. to one 85 × 85 mm., and 30s. to one 82 × 90 mm., and was put on the same mark as a 5 h.p. machine. I am therefore expected to get as much out of a 2½ h.p. as other people do out of 5 h.p.

As regards the last Brooklands meeting, I endorse all Mr. Collier says. Although in a bad enough position myself (I should have had to travel nearly seventy miles per hour with a 4½ h.p.—an utter impossibility—to get amongst the leaders), there were others in a far worse position. It was plain to everybody who knew anything about motor cycles who would win before the start. In proof of this one of the bookmaking gentry was unable to pay out over the winner. It was not as though the winner's form was unknown; his form was well-known. The sooner the handicappers handicap bore and stroke only and not a man's reputation the better.

W. W. GENN.

An Easy Starting Device.

[3613.]—Allow me to suggest a method I have tried for simplifying starting of a motor cycle engine. First of all obtain a short length of ¼ in. diameter copper tubing, drill a

hole in the induction pipe as near the inlet valve as possible, and insert the tube in an upright position. Before tube is screwed into the inlet pipe it should have the end which goes in the induction pipe closed except for a very small hole. The other end is led to a convenient position for inserting the nozzle of an oil tin while the rider is seated in the saddle. The method of operation is: Fill the oil tin with petrol, insert nozzle in top end of tube, place one foot on pedal, and simultaneously push down and squeeze oil tin. The result is an immediate explosion. I find it very convenient in traffic. (Tube should be made easily detachable to enable small hole in lower end to be cleaned out.)

HENRY GRAFTON.

Safeguarding Deaf Cyclists.

[3614.]—Referring to the paragraph in "Current Chat" of September 30th, under the above heading, I have for some time been considering this matter, and have come to the conclusion that as the triangle is now known to and understood by all road users as a warning signal, the best device for deaf persons to adopt would be a triangle in red either on the back of the jacket or on the back of the motor or other cycle. I think it would be a pity if another signal comes into general use, as the triangle is adequate in every way.

F. J. HADFIELD.

Motor Cycle Lamps.

[3615.]—I have much pleasure in supplying just those remarks from personal experience which were lacking in your notes on the Powell and Hanmer lamps in the last issue. I have been riding with one of the separate generator type for the last 3,000 miles, and have nothing but praise for it. With regard to the lamp, it has had some fairly rough usage, but not a mark is there on it. I recommend buyers, however, to put in the biggest Bray's burner that the lamp will take. I found the burner supplied apt to choke back the gas and so prevent a free flow of water, due to the minute holes being slightly too microscopic.

The generator is all that can be desired, and supplies a very steady flow of gas. The clip is an excellent device, and I have it fixed in a rather novel position, namely, on the upright stem of the handle-bars. This brings the generator well under control, but care must be taken to prevent any possibility of the clip slipping down. To obviate this, I have first wound insulating tape round the tubing, then screwed the clip well up, put on lock-nuts, and finally run a small strap round the clip and the boss of the handle-bars. Now I set off on a trip of any length with the utmost reliance, and can be sure of a light at less than a minute's notice.

One final tip, suitable for any lamp with exterior india-rubber tubing, and which I do not recollect seeing published in *The Motor Cycle*. If there is any difficulty with the tubing collapsing or bending, and so shutting off the gas, a light spiral spring, threaded on the tubing and with one end hitched also over the lug on the lamp, will at all times secure a gentle curve for the tube and prevent all possibility of the gas supply being cut off. I have adopted this, as a matter of fact, at both ends of the tubing.

I may add the usual statement that I am absolutely uninterested in the sale of these lamps, but a most satisfied user.

WILLIAM PERCY.

The Lightweight Question.

[3616.]—As the owner of a lightweight for six months, perhaps your readers would like to hear my experiences with it, as against a heavyweight. Last year was my inglorious novitiate in motor cycling. My brand new $3\frac{1}{2}$ h.p. heavyweight rendered me an object of pity to my clubmates from the knack it had of "letting me down" (in more ways than one). Then I had a two-speed gear and free engine fitted, and that did not improve matters; so after doing 500 miles

in ten months, I sold the white elephant at the first chance and invested in a lightweight. From the first I was delighted with it; for easy starting, quiet and smooth running, remarkable flexibility, economy in petrol (but not in oil), handiness and absence of heart-strain in pushing (when necessary), ease of control, and "legal limit," it was a perfect contrast to the ponderous one.

It will also interest the disputants on the subject of starting to know that the lightweight, in my opinion, needs neither handle starting nor stand. To start, I never "warm up" on the stand, but merely squirt paraffin into each cylinder, walk machine a few yards to slacken pistons, bestride the saddle and push down the off pedal.

Last August I accompanied a friend to London without a stand, and returning alone did the 240 miles in about fourteen hours, including several halts for thunderstorms and usual meals; but both ways I had no mechanical stoppage or puncture. The machine is a Moto-Rêve variously improved. It now weighs 112 lbs., rider 11 st. 9 lb.; mileage to date, 1,474 miles. Of course I have no interest in the sale of the machine.

ISAAC IVEY, M.B., Ch.B.

Running on Benzol.

[3617.]—In reference to letter 3576, signed "Medicus," I suppose by what he terms benzol he means benzoline. I would like to know for certain, and if he used any other than the ordinary carburetter as supplied on motor cycles? I should consider an increase of twenty miles per gallon good if the engine does not lose its power. I would like to know these particulars from "Medicus."

CONSTANT READER.

Competitors in the Worcestershire M.C.C. Reliability Trial, described on page 828.

A Problem to be Solved.

[3618.]—There appears to have been some controversy lately in *The Motor Cycle* respecting the particular phenomenon of an engine accelerating when the exhaust valve is slightly raised by means of the exhaust lifter. Two reasons have been advanced to account for it.

It has been stated that the carburetter is not getting sufficient air at high speeds; while some say the compression is too high, and by raising the exhaust valve the compression is reduced a little. With respect to the first reason, I know three owners of a certain make of engine who all find an increase of speed when the valve is raised, and yet each rider has a different carburetter, and they can all give much more air than the engine will take.

With reference to the second reason, this also seems to me a wrong explanation, as, if an engine was too high in compression and raising the exhaust valve lifter would account for the improvement, then one would naturally say by the same reasoning, that the engine would run faster if the valves required grinding, as a little escape past the seatings would be equal to slightly raising the exhaust valve lifter, and I know from experience this is not so.

My engine is a large single-cylinder. I can get more air than is required at the carburetter. The silencer is extra large, and there is absolutely no back pressure, yet I can always run faster with exhaust valve lifted a little, and find

THE MOTOSACOCHE

possesses advantages over all other motor cycles which cannot be disputed or under-estimated. It is very light. All its motor mechanism can be removed from the cycle in the space of a few minutes. It is clean. It is reliable. It is silent. It will travel from 5 to 30 miles per hour. It will ascend gradients of 1 in 10 without pedal assistance. AND, it is economical both in first cost and upkeep.

The MOTOSACOCHE is £30 only.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

The "GRADUA" (Infinitely Variable) Gear for Belt-driven Machines.

AN ABSOLUTELY NEW PRINCIPLE.

**NO END THRUST! NO JOCKEY PULLEY!! NO SLACK BELT!!!
SAVES PETROL. SAVES OVERHEATING. SAVES TYRES.
HANDLE STARTING—FREE ENGINE.**

DIRECT DRIVE ON ALL SPEEDS.

This gear gives infinite variation from zero to $3\frac{1}{2}$ to 1. It is absolutely fool-proof.

No sudden jamming in of gear and wear and tear to the machine. A simple turn of a small wheel is all that is necessary.

The rider gets full power of his engine by never overloading, and by keeping up the number of its revolutions.

Hills have no terror with a "GRADUA" gear!

A perfect free-engine position is assured; the engine can be started with a handle and the rider take his seat while the machine is at rest.

All who have seen and tried it are enthusiastic about its many merits. It's a revelation to riders using two-speed gears! Nothing like it in the world! It will revolutionise the present system of variable-gears.

To prevent disappointment, we would point out that it cannot be fitted to existing machines.

When ordering your new mount, **insist** on its being built with a "GRADUA" gear. We are prepared to grant licences to other makers for building this gear under royalty.

The famous "Zenette" Spring-frame Motor Bicycle-de-Luxe will in future be built with "GRADUA" gear, the price inclusive being 50 guineas nett cash.

Further orders for "Zenettes" with the "GRADUA" must be placed **at once** if required for Autumn delivery: we can accept a limited number only, as our present works are of limited capacity.

A "Zenette" fitted with a "GRADUA" variable gear may be tried (by appointment **only**) at

ZENITH MOTORS, LTD. Showrooms: 119, Stroud Green Road, LONDON, N.
(Nearest Station, Finsbury Park).

Makers of the celebrated "Zenith Bicar," price 43 guineas nett cash; and of the "Zenith" Tricar, price (with 6 h.p. J.A.P. twin-cylinder engine, chain drive, two-speed gear), 72 guineas nett; the "Zenette" Tricar-de-Luxe (with 6 h.p. twin-cylinder engine, finest coach-built body, open frame), 90 guineas.

The action of the "GRADUA" Gear is Simplicity itself. NO COMPLICATIONS.

Watawata

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

the engine runs badly if the valves are not well ground in.

Is it possible that the cause can be accounted for as follows : When the exhaust valve lifter is raised to just lightly touch the tappet, it prevents the clatter of the valve, causes smoother running, and as a further result, faster running?

A. LEVER.

An Automatically Variable Pulley.

[3619].—Having seen the drawing of the automatically variable pulley, patented by Mr. Lloyd, I find that it is very much like one that I made and have running at the present time. I made it twelve months ago. It varies according to the rise and fall of road, but I find a difficulty in taking up the slack belt. I have tried a jockey pulley, but it does not act correctly. Anyone can see it at any time; I have it fitted to a $2\frac{3}{4}$ h.p. Minerva. I have found in the patent list that a pulley something like it was patented by a Mr. Payne four years ago.

MILFRED PARKINSON.

[3620].—In the issue of October 7th you refer to an automatically variable speed pulley for motor cycles for which a patent has been taken out by Mr. Lloyd, of Birmingham.

I may mention that for over twelve months I have had in use a pulley of my own construction which is practically identical, except in one or two small details.

In my pulley the sleeve with fixed flange is bored out at the flange end to fit the taper engine shaft ($2\frac{3}{4}$ h.p. Minerva), and at the other it is bored out to allow the ordinary nut to be screwed on to the engine-shaft to hold the pulley in place. The loose flange fits on the sleeve and slides on two small feathers let into the face of the sleeve on opposite sides. The compression spring for holding the loose flange up to its work is placed over the outside of the sleeve; the end of the latter is threaded to take a thin circular nut which keeps the spring in compression against the outside face of loose flange, and thus keeps same up to its work.

In practice I found it necessary to experiment with springs of various strengths until I obtained one that would withstand the full engine power, but would give when the pull on belt reached a point that would have caused the engine to slow down.

In my pulley I am able to adjust the spring to a nicety by either screwing tighter or slacking off the circular nut. This nut is locked in position when adjusted by means of a small plate recessed into its face, the end of which fits into one of two grooves cut in face of sleeve where threaded (adjustable to half a turn).

I am not writing this with a view to disputing Mr. Lloyd's patent, as I had no idea of dealing with it commercially, but merely to claim the right to use the one I already have, which might otherwise appear to be an infringement of Mr. Lloyd's patent.

H. LLOYD WRIGHT.

Abnormal Petrol Consumption.

[3621].—With reference to letter 3590, October 7th, I think your correspondent "Snomysigh" will find the cause of his trouble in his inlet valve spring, which is evidently not acting properly.

That the valve does not close correctly will be seen by the fact of his engine blowing back into the carburetter on firing stroke, causing the blackening of throttle, and sudden ejection of mixture through air inlets.

I would advise him to get several springs made of fairly light gauge wire, say Nos. 19, 20, and 21, of various lengths in each gauge, with small diameter coils (about $\frac{3}{16}$ in. or nearest that will go on the stem of valve seating without rubbing), and experiment with these.

The spring should be well compressed when in position and have a nice sharp action consistent with ease in opening when under suction.

I think he will find a light spring well compressed much better than a heavy gauge wire spring under less tension.

Another point "Snomysigh" (getting used to writing the name now) should look to is to see that his inlet valve opens well into the valve chamber. Sometimes thick washers are used which prevent this, causing late opening and closing of the valve.

DENBIGH COLLET.

The Lubrication of Bearings.

[3622].—In a recent issue of *The Motor Cycle* "Ixion" pointed out that if a main bearing bush turns round slightly in its aluminium bed the supply of oil to that bearing is cut off, owing to the hole in the bush being out of register with the hole in the aluminium, and as a cure he suggests pegging or otherwise positively fixing the bush to prevent turning.

I should like to add another suggestion which, although it does not prevent the bush from turning, does prevent the stoppage of the oil supply if the bush should turn.

The remedy is to turn a groove on the outside of the bush, and drill in the groove as many holes as are considered necessary for efficient lubrication. The accompanying sketch will explain my meaning.

Of course the groove must be at such a distance from the end of the bush that the oil channel in the aluminium will deliver a supply of oil into it (the groove).

The above is a common practice with locomotive coupling rod bushes, and it follows that, however many revolutions the bush may choose to make, the oil will still reach the bearing *via* the groove and holes. If the bush is too thin to allow of a groove being turned in it, a groove in the aluminium surrounding the bush would serve the same purpose.

F. C. R. DOUTON.

A. Oil channel.
B. Bush.
C. Crank-case.
D. Groove in bush.
E. Holes in groove.

A. Loose flange.
BB. Feathers.
C. Coil spring.
D. Circular nut.
E. Plate and screw locking nut.
F. Engine shaft.
H. Nut on engine-shaft.

Motor Cycling in the States.

[3623].—As a native of Walthamstow, England, from which place I came five years ago to New York City, and as a reader of your first-class paper, which beats anything of its nature in America, I would like to say that I am very glad to see how motor cycling has come into such favour in the old country. Looking back five years, I cannot recall having seen a motor cycle upon the highways.

I have taken up the pastime during the last two years, and have ridden a number of American machines. The Indian is probably the best, and I am touring on one from New York City to Los Angeles. I have just come over vile roads through the Alleghany Mountains—rocks and sand, myriads of stones and crevices.

I do not believe in belts, but I do in other features of European design, such as low trussed frame, long wheelbase, 26in. wheels, magnetos, tanks in the middle, vertical motor, etc. Personally, I consider the F.N. four-cylinder latest design low frame to be almost ideal. I hope to return to England and tour the country with one of these machines.

I see Walthamstow has now a motor cycle club, and notice many familiar names. Perhaps if you insert my letter it would catch the eye of some friend of mine who is also now a motor cyclist.

New York.

EDWARD O. DUNKLEY.

EXPERIENCES WANTED.

"A. K." (Croydon) would like readers' experiences of the Cowey or other speed indicator with dial on handle-bar.

"H.J.S." (Dublin) would like users' experiences of four-cylinder 1908 F.N. with Montgomery flexible sidecar.

"F.W.W." would like readers' experiences with two or three speed gears on the sun and planet system suitable for belt driven motor cycles.

"R.M.P." would like to know if any reader can recommend from personal experience a really good enamel for motor bicycles which can be applied with a brush?

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

CURRENT CHAT.

SPECIAL FEATURES.

THE QUARTERLY TRIAL LAST SATURDAY.

SOME USEFUL ACCESSORIES.

WHICH IS THE BEST SIDECAR?

TIME TO LIGHT LAMPS.—Oct. 21st, 5.55 p.m. ; Oct. 24th, 5.49 p.m. ; Oct. 28th, 5.41 p.m.

Mont Cindre Hill-climb (France)

The above event took place in the neighbourhood of Lyons. The results on formula placed Magnat Debon machines first and second, Moto Rêve third. Other makers which were represented were Keller Dorian (1), Peugeot (2), Griffon (1), Magnat Debon (4), Moto Rêve (2).

Motoring in Salonica.

Mr. Acting Vice-consul E. H. Mulock, reporting on the consular district of Salonica for 1907, states: "Automobiles, in spite of the removal of the embargo on their importation, have not as yet increased in number, though two are reported to have been ordered; but motor bicycles are beginning to be used."

Police Arrangements in Sussex.

Motor cyclists visiting the neighbourhoods of Brighton, Eastbourne, and Hastings should be extremely cautious how they proceed, as the police are said to be very active in these quarters. Long distance traps are being worked all day and every day, the venues being moved every few days. The victim is entirely unaware he has been caught until he receives the unwelcome blue paper about five days afterwards.

An Important Point to Remember.

Readers are continually writing to the editor and asking if it is legal for a bench of magistrates to insist upon a licence being endorsed for such a trivial offence as having a lamp go out, etc. We would therefore like to point out that, to put it briefly, the law infers that a motorist's licence may be endorsed for every offence he is capable of committing in connection with the driving of his mount, except the first or second conviction for exceeding the speed limit.

A Reliability Trial in the Antipodes.

A reliability trial was completed at Sydney last month which threatened to go on for ever. The distance was one hundred miles, and the course was covered several times in order to gradually weed out the least reliable machines. In the last two runs there were three competitors left in the trial, the machines being a 5 h.p. twin N.S.U., a $3\frac{1}{2}$ h.p. Triumph, and a $2\frac{1}{4}$ h.p. Sarolea. In the final run an exhaust valve broke in the Triumph and a gudgeon pin set-screw worked loose in the Sarolea engine, so the N.S.U. rider won after all.

The Chateau Thierry Hill-climb.

The following makes of motor cycles were represented at the Chateau Thierry Hill-climb on the 18th inst.: Herdtle-Bruneau, Motosacoche, Quentin, Albatross, Lurquin - Coudert, Peugeot, and Ronteix. The names of the winning mounts will be announced next week.

Ten Mile Limit at Watford.

Watford has established the ten miles speed limit, the boundaries on the main road extending from the railway bridge at Bushey to the cross-roads at the other end of the town, just beyond the fire station. Mr. G. McK. Gordon asks us to point out to readers that the warning posts have been placed at points where one's attention is immediately concentrated on cross-roads, and motorists may easily pass the notices without observing them, and fall a prey quite unintentionally.

Notifying Change of Address.

A few days ago at the Burnley Borough Police Court several motorists were fined for failing to notify their change of address to the authorities, so that the alteration might be made in the register. One of the defendants, Mr. H. Colebrook, May Street, Burnley, personally notified one of the officials on April 16th, 1908, of his change of address when renewing his driving licence. He had his registration paper with him, but thought that one notification would suffice. Mr. Colebrook has a receipt for the transfer registration of an old machine and a previous

licence dated 1906, showing that both registration and licence are dealt with at the same office. This fact makes his case, at any rate, a very trumpery one. Although the defendants consented to pay the costs, they only did so to prevent a conviction being recorded against them, which would have meant an endorsement on their driving licenses.

A Right-minded View.

Mr. Joseph Shepherd presided at a meeting of the Darlington Chamber of Agriculture last week, when the members discussed the Motor Car Act. Mr. Gibson said they should insist upon the speed limit regulation in the Act being rigidly enforced. There was no reason in any policeman setting a trap for motorists on a straight piece of road, but he should stop motorists and not allow them to go through villages at a dangerous speed.

Motor Cycle Frightens a Restive Horse.

Through a restive horse shying at a motor cycle ridden by J. H. Calvert, of Eston, the driver, a Middlesbrough man named Charles Peacock, was knocked down, and received fatal injuries. Deceased's son was also with the cart, and he said at the inquest that he put up his hand to the motor cyclist in warning, but he did not stop. Witness added that the horse was afraid of motors, and that was why two went with the load. The adjourned inquest was to be held yesterday (Tuesday) to enable Mr. Calvert and other witnesses to be present.

In full flight at Brooklands. A British rider and machine now holds the world's hour record, C. R. Collier having tacked 6 miles 787 yards on to Giuppone's old record of 63 miles 1,078 yards.

Motor Cycles at the Stanley Show.

We have perused a list of the Stanley Show exhibitors, and it seems likely that there will be even more firms showing motor cycles and accessories than there were last year.

North Islington Conservative and Unionist Trial.

The first annual reliability trial from Highgate to Peterborough and back (152 miles), for the silver cup presented by the president, Mr. George A. Touche, was won by H. E. Davison, A. A. Frith being second (gold medal), and Messrs. Jennings and Jackson tied for third place (silver medal).

Machines in the Quarterly Trials.

Among the twenty-eight competitors in the single-cylinder class there were thirteen private owners, and one private owner out of five entrants in the passenger class.

There is no mistaking the enormous popularity of magneto ignition, for all but three of the bicycles were equipped with magnetos.

Of the motor bicycles entered for last Saturday's Uxbridge to Banbury and back trial, there were seventeen with twin-cylinder engines and fourteen with single-cylinder engines. There were two tricars, one with a single and one with a twin-cylinder engine.

There were half a dozen lightweight motor bicycles entered for the Trial and all started, and on the whole performed very creditably. As we have stated before, it is on treacherous greasy surfaces where lightweight bicycles score.

Plain-treaded Tyres and Side-slips.

The heavy rain of last Friday night in the London district caused the surface of the roads to be very heavy and slippery, particularly in Islip, with the result that several competitors in the Quarterly Trials were caught napping. Smooth treaded or worn tyres are almost certain to cause side-slips on motor bicycles, as one or two discovered, with the result that they did not make non-stop runs, although they experienced no mechanical troubles whatever. Studded tyres are a certain preventive of side-slip, provided ordinary care is taken at corners and in accelerating the speed of the engine. We recommend all riders in the autumn and winter to have these tyres fitted to their machines.

Motor Union Notes.

A meeting of the Motor Cycle Committee of the Motor Union was held at the offices a few days ago, when the Rev. F. W. Hassard-Short presided. Motor cyclists joining the Motor Union at the present time may do so for twelve months ending September 30th next. The motor cyclist's subscription of 10s. 6d. includes full privileges of membership with a copy of *The Motor Cycle*, while the subscription of one guinea includes, in addition to the advantages of membership, the privilege of insurance against third party risks, and a special insurance policy for any privately owned motor bicycle not exceeding 5 h.p., covering fire, explosion, or self-ignition up to £30.

A Police Patrolled Road.

A Manchester reader asks us to warn motor cyclists to drive slowly and carefully on the road between Oldham and Manchester, especially between Miles Platting Railway Arch and the boundary line of Newton Heath and Fails-worth.

Police Traps.

Hambleton, on the Leeds and Selby Road.

A short distance before Selby, on the Doncaster-Selby Road.

Fryston corner, on the Fairburn-Tadcaster Road, about three or four miles from Fairburn.

A trap is in operation through the village of Towton, which is two miles

Cycle, that old-established firm of pedal cycle makers, the Premier Cycle Co., Ltd., Coventry, has decided to manufacture a motor bicycle on popular lines for 1909. The specification of this machine is as follows: Specially low built frame, 3½ h.p. White and Poppe engine, 80 by 85 mm. bore and stroke, Bosch high tension magneto, B. and B. carburetter, handle-bar control and spring forks. The firm has been at work on this new pattern for some time, and hopes to have thoroughly tested samples ready for exhibition at next month's Stanley Show.

A Motor Cycle Street Sweeper.

At the International Road Congress in the Tuilleries Gardens, Paris, there was a motor cycle street sweeper exhibited by an Austrian corporation. From its appearance it would seem that it has been in use for some time. It was a three-wheeled machine, something like a bicycle with rigid sidecar attachment, with the brush, dustpan and bin in the place of the passengers' seat. Steering was by the usual handle-bar, the front wheel of the bicycle being linked up with the outer road wheel of the sweeper. A single-cylinder fan-cooled engine propelled the machine through a chain drive and reducing gear. The brush was operated at the same speed as the rear wheel of the bicycle by means of a direct gear drive. The brush was not placed diagonally, but cast its dirt into a dust pan hung close to the ground.

The Timed Ascent of Dashwood.

It is some little time since T. H. Tessier took part in motor cycle competitions, and he signalled his re-appearance on Saturday in the Autumn Quarterly Trials by beating the Dashwood Hill record (previously held by W. H. Wells) by several seconds. He rode a pedalless twin-cylinder Bat-Jap.

FUTURE EVENTS.

Oct. 21—Motor Union General Committee Meeting.

Nov. 13-21—OLYMPIA AUTOMOBILE EXHIBITION.

" 18—Motor Union Annual Dinner at the Hotel Great Central, London.

" 20-28—THIRTY-SECOND ANNUAL STANLEY SHOW, at the Agricultural Hall, Islington.

" 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.

Dec. 16—Motor Union General Committee Meeting.

from Tadcaster on the Tadcaster and Doncaster Road. Altogether the Doncaster district appears well provided for.

Cross-roads Branham Moor, where Great North Road crosses Leeds and York Road.

New Pattern Motor Cycles.

In addition to the new model Humber motor bicycle which has already been referred to in *The Motor*

Preparations before the start of the A.C.U. Autumn Quarterly Trial, in the Hotel Yard at Uxbridge.

The Autumn Quarterly Trials.

THE popular and useful "quarterly" competitions organised by the Auto Cycle Union are supposed to be held every three months—in the autumn, in the winter (February), in the spring, and in the summer—but, owing to the number of events which take place in the latter season, the summer event has been abandoned during the last two years; but the popularity of these trials is so unmistakable that four times a year seems hardly too often to hold them. Last Saturday thirty-four entries were received, and of these the following riders started: H. G. Hill (5 h.p. Vindec), H. G. Potts (6 h.p. twin Riley), W. G. McMinnies (3½ h.p. Triumph), W. H. Wells (5 h.p. Vindec), W. Smith (2 h.p. Motor-Rêve), G. L. Fletcher (2 h.p. Moto-Rêve), J. V. Robinson (1¼ h.p. Motosacoche), T. H. Tessier (6-7 h.p. Bat), H. Newey (3½ h.p. L.M.C.), F. W. Applebee (5 h.p. Rex), W. Douglas (2¾ h.p. Douglas), E. Clark (2¾ h.p. Douglas), T. S. V.

N.S.U. and sidecar), and a totally new and original tricar, which we shall describe shortly, the 5 h.p. A.C. driven by J. Portwine.

The Roads Very Heavy.

The weather at the time of the start from the Chequers Hotel, Uxbridge, was far from favourable, and a typical autumn morning (damp and misty) welcomed the competitors. The roads, sodden by the heavy rain which had fallen during the night, were excessively muddy, and in consequence very treacherous, while only where the roads were tarred was the going even passably good. The road surface on Dashwood Hill was, however, firm and binding and in very fair condition, so that several of the performances on this famous ascent were distinctly noteworthy. Unfortunately, the men came up mostly in close order, and this, coupled with the fact that the numbers on their armlets were difficult to distinguish, made it

Martin Geiger making a splendid ascent of Dashwood on a 6 h.p. N.S.U. with sidecar. He also made a non-stop run.

Competitors waiting at the foot of Gore Hill, Amersham, for the timekeeper to despatch them at one minute intervals.

Phillips (1¼ h.p. Motosacoche), P. Weatherhilt (3½ h.p. Zenette), F. W. Barnes (3½ h.p. Zenette), H. C. Partridge (6 h.p. N.S.U.), G. F. Cooper (5 h.p. Vindec), R. Samson (3½ h.p. L.M.C.), R. J. Bell (3½ h.p. N.S.U.), W. H. Bashall (6-7 h.p. Bat), A. W. Bentley (3½ h.p. Triumph), D. F. Steeves (3¾ h.p. N.S.U.), G. R. Mead (3½ h.p. Triumph), A. H. Davison (5 h.p. Vindec), and W. Pratt (3½ h.p. Phelon and Moore). Passenger machines.—Dr. E. W. Brewerton (10 h.p. Lagonda tricar), J. S. Shaw (6 h.p. Phänomen and sidecar), M. Geiger (6 h.p. N.S.U. and sidecar), F. Eagles (6 h.p.

almost impossible to establish their identity at times. The times on both Dashwood and Gore Hills were not given out to the press, but the difference in seconds between the fastest competitor is stated: T. H. Tessier 0, W. G. McMinnies 3⅜s., and W. H. Bashall 6s. Tessier and McMinnies beat the previous record established by Wells, while Bashall was only within ⅜s. in equalling it. Next in order came A. W. Bentley (of End-to-end fame) 8⅜s., W. H. Wells 14⅜s., G. F. Cooper 16⅜s., F. W. Applebee 21s., G. R. Mead 23s., R. J. Bell 45⅜s., R. Samson 46⅜s., H. Newey 47⅜s., A. H. Davison 49⅜s.,

The Autumn Quarterly Trials.—

D. F. Steeves $53\frac{4}{5}$ s., and F. W. Barnes $56\frac{4}{5}$ s. Up to this point all the best performances of the medium weight machines are recorded. The remainder are the fastest lightweights and those of the larger machines which Fortune did not favour. W. Douglas (excellent) $59\frac{3}{5}$ s., G. L. Fletcher (very good) 1m. $1\frac{2}{5}$ s., E. Clark (pedalled slightly) 1m. $1\frac{3}{5}$ s., W. Smith (pedalled slightly) 1m. $10\frac{4}{5}$ s., W. Pratt (came up in good form on low speed) 1m. $13\frac{2}{5}$ s., J. V. Robinson (pedalled) 1m. 16s., P. Weatherhilt (came up steadily on low gear) 1m. $16\frac{1}{5}$ s., and T. S. V. Phillips (pedalled) 1m. $46\frac{2}{5}$ s.; H. G. Hill and H. G. Potts dismounted. Of the passenger machines the two N.S.U. sidecars performed most creditably. Eagles made the fastest time 0, and Geiger came 6s. behind; Dr. Brewerton's Lagonda was $39\frac{2}{5}$ s. behind Eagles; Portwine's A.C. tricar was going well, but the driver slowed down before reaching the timekeeper, 1m. $9\frac{2}{5}$ s.; J. S. Shaw (6 h.p. Phänomen sidecar) 1m. $10\frac{2}{5}$ s. From Aston Rowant the roads improved slightly, but greasy patches accounted for several sideslips. Partridge had a bad skid in Wycombe—bent his handle-bar and broke his pedal crank—and had to retire. Pratt recorded a weird accident near Islip. He and Davison were riding together when the former shot ahead to leave room for a car overtaking him. Somehow or other Davison came off, and his machine went on, caught up Pratt, caught its handle-bar in his coat, which was the first intimation Pratt received of the affair, and then he tumbled in the ditch, leaving the machines buzzing merrily in the road. Fortunately, neither man was much the worse for the spill. At Banbury twenty-seven machines arrived, and twenty-six left on the return journey, while up to that stage in the competition there were four retirements—Partridge and Hill (side-slips), Portwine (trouble with coil), and Phillips. After lunch the roads improved in places, and in the afternoon the sun came out.

The Second Test Hill.

At Gore Hill, Amersham, the first batch of competitors arrived dead on time. The surface of the hill—and of the rest of the road leading to Beaconsfield—was very bad, thick heavy mud, mostly of a slimy nature, covering the major portion. The results of the climb were as follows: W. H. Bashall 0, W. G. McMinnies $6\frac{3}{5}$ s., W. H. Wells $12\frac{2}{5}$ s., F. W. Applebee $18\frac{1}{5}$ s., T. H. Tessier 19s., G. F. Cooper 20s., H. G. Potts $23\frac{2}{5}$ s., A. W. Bentley $26\frac{1}{5}$ s. (impeded by sidecar), R. Samson 27s., H. Newey $28\frac{4}{5}$ s., D. F. Steeves $32\frac{1}{5}$ s., G. R. Mead $34\frac{2}{5}$ s., F. W. Barnes $36\frac{1}{5}$ s., A. H. Davison $36\frac{3}{5}$ s., E. Clark (pedalled) $48\frac{1}{5}$ s., W. Douglas $50\frac{1}{5}$ s., G. L. Fletcher $53\frac{1}{5}$ s., R. J. Bell (came up well on low speed) $56\frac{1}{5}$ s., W. Smith 57s., J. V. Robinson 1m. $33\frac{3}{5}$ s., and P. Weatherhilt (came up slowly on low gear) 1m. 43s. Passenger machines.—M. Geiger 0, F. Eagles 14s., Dr. Brewerton $44\frac{3}{5}$ s., and J. S. Shaw 2m. $3\frac{4}{5}$ s. (stopped on crest of hill owing to slipping belt). It is interesting to compare the results of the two hill-climbs. Gore Hill is the more severe of the two, as regards surface, gradient, and approach, and for the convenience of the timekeepers it has to be taken from a standing start.

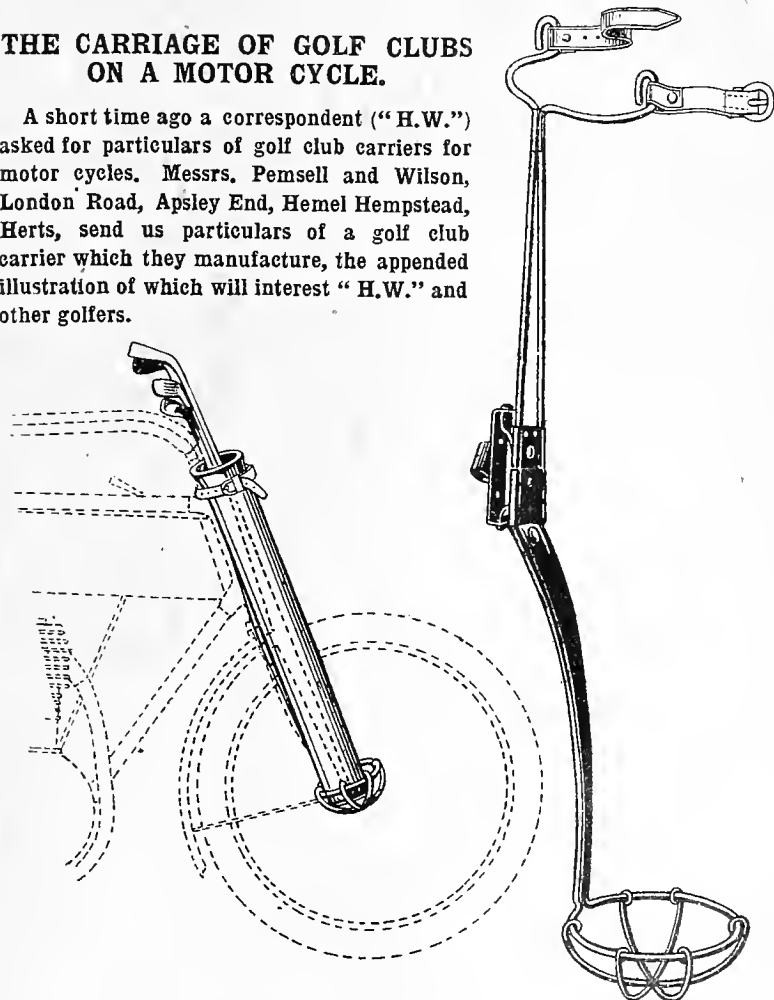

Of the competitors who completed the course inside maximum time, the following had no involuntary stops of any kind: W. G. McMinnies ($3\frac{1}{2}$ h.p. Triumph),

W. Smith (2 h.p. twin Moto-Rêve), J. V. Robinson ($1\frac{1}{4}$ h.p. Motosacoche), H. Newey ($3\frac{1}{2}$ h.p. L.M.C.), F. W. Applebee (5 h.p. twin Rex), E. Clark ($2\frac{3}{4}$ h.p. twin Douglas), W. Douglas ($2\frac{3}{4}$ h.p. twin Douglas), P. Weatherhilt ($3\frac{1}{2}$ h.p. Zenette), R. J. Bell ($3\frac{1}{2}$ h.p. N.S.U.), G. F. Cooper (5 h.p. twin Vindec), R. Samson ($3\frac{1}{2}$ h.p. L.M.C.), and D. F. Steeves ($3\frac{3}{4}$ h.p. N.S.U.). In the passenger class, F. Eagles and M. Geiger, on twin-cylinder N.S.U.'s with sidecars, and Dr. Brewerton's twin Lagonda. The two above mentioned sidecars, which ran splendidly and behaved especially well on the two test hills, are the first passenger machines of this kind to cover the course successfully. Stops of a non-mechanical nature, which do not necessarily detract from the performances of the machines which experienced them, were made by: A. W. Bentley ($3\frac{1}{2}$ h.p. Triumph), side-slip; F. W. Barnes ($3\frac{1}{2}$ h.p. Zenette), puncture; T. H. Tessier (6-7 h.p. Bat), replaced tube; G. L. Fletcher (2 h.p. Moto-Rêve), tyre troubles; W. H. Bashall (6-7 h.p. Bat), traffic stop; G. R. Mead ($3\frac{1}{2}$ h.p. Triumph), side-slip; A. H. Davison (5 h.p. Vindec) and W. Pratt ($3\frac{1}{2}$ h.p. P. and M.), accident mentioned previously; H. G. Potts (6 h.p. Riley), throttle spring came loose and caused throttle to close, also side-slip; J. S. Shaw (6 h.p. Phänomen and sidecar), belt trouble and compression tap opened itself.

In the article on motor cycle lamps published in last week's issue it was stated, in consequence of a misinterpretation of a letter from the makers of the Glare electric headlights, that the bulbs used in these lamps consume rather more current than some others. This should have read that the *tricar headlight*, which gives more light than the smaller one supplied for motor bicycles, is fitted with a special bulb, which consumes rather more current than the bicycle size.

THE CARRIAGE OF GOLF CLUBS ON A MOTOR CYCLE.

A short time ago a correspondent ("H.W.") asked for particulars of golf club carriers for motor cycles. Messrs. Pemsell and Wilson, London Road, Apsley End, Hemel Hempstead, Herts, send us particulars of a golf club carrier which they manufacture, the appended illustration of which will interest "H.W." and other golfers.

CLUB NEWS.

Perth and District M.C.C.

The annual general meeting will be held in the Windsor Restaurant, John Street, on Friday, October 30th, at 8 p.m. It will be followed by a supper and smoking concert.

Scarborough M.C.C.

On Wednesday, 7th inst., a reliability trial to Hull and back was held. Every competing machine proved most reliable, none of the competitors dismounting except at the fixed stopping places. The route was by Bridlington, Driffield, and Beverley. In the members' event Mr. Truefit (captain) 2 h.p. Moto-Rève) and Mr. Pugh (3½ h.p. Minerva) returned cards so identical that the committee declared a dead heat, and the trial must be re-run. The open event was won by Mr. Waines on a 2 h.p. Minerva. Members of the Hull and East Riding A.C.C. checked the competitors.

Great Yarmouth and District M.C.C.

The above club held its autumn dinner on the 10th inst., at the Maid's Head Hotel, Norwich. There was a very good muster of members. After dinner Dr. H. R. Mayo read a paper on his "Experiences in the End-to-end Run." This was full of interesting matter, and was followed by a discussion by those members who had been through similar runs and experiences.

Newcastle and District M.C.C.

On Wednesday last, a party of about fifty members of the above club journeyed down to Jarrow-on-Tyne to view H.M.S. *Lord Nelson*, by the special invitation of the commanding officer, Captain Sir R. K. Arbuthnot, Bart., R.N., who is a member of the club. The party were personally conducted round the ship by their host, and he went

to great pains in explaining all the various interesting and vital features of this huge battleship. On behalf of the members, thanks were returned to the Captain by the Chairman (Mr. E. Hawkins) and the Hon. Secretary (Mr. S. W. Carty), and the Captain, in reply, stated that it was through his membership of the club and the continuous riding he had in its competitions that he had been enabled to make

Competitors in the Scarborough and District M.C.C. Reliability Trial to Hull and back.

himself fit to ride in the open events held by the Auto Cycle Union and the Motor Cycling Club, in all of which he had been successful. The *Lord Nelson* leaves the Tyne to-day, on some months' cruising, before she is commissioned as the second flagship of the Home Fleet, and she carries with her the good wishes and respect of all the members of the club for her worthy Captain, who is a typical British sportsman.

Middlesbrough and District M.C.C.

Under the auspices of the Middlesbrough Club, a smoking concert was held at the Grand Hotel, Middlesbrough, last Wednesday evening, at which a large number of motor cyclists were present. Mr. Stanley A. Sadler presided, and presented the prizes won by the members during the year. A most enjoyable evening was spent by all.

The club is arranging for a trip to London to see the Stanley Show on November 22nd. The members of the Hartlepool Club have been invited.

Worcestershire M.C.C.

On the 11th inst. the above club held its autumn reliability trial over a twenty-seven miles course, which had to be covered four times, making 108 miles in all. Out of twelve starters, nine finished without any mechanical trouble. Those members who competed are as follows:

G. R. A. Deacon (3½ h.p. Rex), 1,000 marks; H. B. Denley (3½ h.p. Minerva), 1,000; H. J. Folkes (3½ h.p. Triumph), 1,000; A. Jennings (3½ h.p. Triumph), 1,000; L. Pickering (5 h.p. Rex), 1,000; A. V. Wilkinson (3½ h.p. Rex), 1,000; R. T. Wood (6 h.p. N.S.U.), 1,000; N. C. Pollock (3½ h.p. Rex), 996 (tyre stop); L. C. Wakeman (3½ h.p. Ariel), 960 (water in petrol); L. G. Banwell (2½ h.p. J.A.P.) and B. Potter (9 h.p. Elite), retired.

North West London M.C.C.

The result of the hill-climb held by the above club on Aston Hill is given below. The A.C.U. formula was used.

SINGLE-CYLINDER CLASS.

	Fig. of merit.	Time.
A. W. Bentley (3½ h.p. Triumph) ...	75.54 ...	49½s.
W. A. Jacobs (3½ h.p. Rex) ...	82.73 ...	55½s.
T. G. Blundell (3½ h.p. Triumph) ...	84.49 ...	59s.
W. G. Barton (3½ h.p. Triumph) ...	98.33 ...	1m. 18½s.
H. H. Berlandina (5½ h.p. Zenette) ...	135.53 ...	2m. 9¼s.
H. S. Myer (3½ h.p. Rex) ...	161.93 ...	2m. 9½s.

TWIN-CYLINDER CLASS.

W. O. Bentley (5 h.p. Rex and sidecar) ...	107.09 ...	1m. 23½s.
L. F. Scholte (5 h.p. Antoine) ...	122.61 ...	59s.
G. Rowden (6 h.p. Bat) ...	123.76 ...	57s.
G. Davis (5 h.p. Vindec) ...	124.51 ...	1m. 8s.

The curious incident in connection with the climb was that with one exception the order of merit was the order of starting. There were several non-starters. A silver cup in each class has kindly been presented by Mr. C. G. Myer.

W. H. Wells's Twin Vindec making light work of Gore Hill, Amersham, in the Quarterly Trials on Saturday last.

Some Notes on Winter Riding.

I AM one of those unfortunates who chase their daily bread over a large area, and naturally use the humble motor cycle for this purpose; the question of clothes suitable for the winter is, therefore, important to me and others similarly situated, so that perhaps a few notes from one who has experienced the rigours of the English climate at all periods may prove useful.

For winter riding three articles of extra clothing are essential:

1. A short reefer coat with windcuffs, made of cloth and lined with chamois leather. This I obtained from Gamages three years ago at about £2, and have found it excellent value. The name of the coat is, I believe, the Referee.

Carrier with two tool cases and coat between

2. Leggings. These were made for me by the same firm in complete trouser form, a strap round the waist with slits to get at the side pockets and a leather strap to go under the instep. They should be wide enough to pull off over the boots, and should preferably be made of brown mackintosh. This type of legging is infinitely preferable to the ordinary type, since no cold or wet can then penetrate to the stomach, one of the most vulnerable parts of the human frame, and if not adequately protected a frequent source of chills.

3. An umbrella coat with rubber neck. This should not exceed 40in. in length, and should be a full size larger round the neck than one's collar size, otherwise one is slowly but surely throttled. When not required the coat should be wrapped up in a piece of American cloth to prevent chafing and strapped to the carrier. On my Triumph I have a tool bag at each end of the carrier, so the coat can be snugly packed in between and cannot fall off.

Windcuffs are not necessary in the umbrella coat if it is worn over the reefer coat, and I have removed mine in order that the ends of the gloves may be tucked *inside* and not outside the sleeves to prevent rain running down and filling the glove.

For comfort gauntlet gloves with soft ends should be worn, otherwise it is a difficult matter to pack the ends into the sleeves. A silk scarf should always be worn to fill up the chinks at the neck, and a pair of stout boots well nailed will complete the list.

- A. High tension cable.
- B. Extra piece of sheet indiarubber.
- C. Magneto cover.
- D. Magneto stay.
- E. Magneto bracket.

Such an outfit may seem expensive, but it will save many a suit of clothes from mud and rain, enable one to ride in warmth and comfort, and may perhaps save illnesses and consequent doctor's bills.

The machine will need little attention beyond vaselining all bright parts and fitting some form of non-skids to *both* tyres. The magneto should be boxed in, with a rubber covering for preference, care being taken that no wet can run down the H.T. wire. This was prevented in my own case by taking an extra piece of rubber and cutting a small hole in it, so that it had to be stretched before it could be passed over the H.T. wire. This ensured an absolutely tight fit, and water now runs down the H.T. wire and thence down the extra rubber piece, dripping off at the end.

IVAN B. HART-DAVIES.

The Goldschmidt Motor Accessories Co., Ltd., 61, Cleveland Street, London, W., inform us that they are still selling the G motor cycle lamp, which has been successfully used in London-Edinburgh runs. It is a separate generator lamp with 5/8in. lens in centre of door, showing a light 100 yards ahead.

C. R. Collier on his world's hour record of 70 miles 105 yds. at Brooklands.

H. A. Collier and H. Martin, who can be seen in the illustration, signalled his lap times, which were remarkably uniform.

Questions... and Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Illuminating Numbers on Trainers.

[?] I was stopped on the 1st inst. at Mullingar (Ireland) by the Chief Constable, who took my name and number for not having a tail light on trailer behind motor bicycle. I would be obliged if you would tell me if it is compulsory in this country to carry a light on trailer.—P.N.G.

The law says that the back number of a trailer attached to a motor bicycle must be illuminated, as if it were attached to a car—Motor Car (Registration and Licensing) Order, 1903, Schedule IV., Art. IX.).

Buying a New Mount.

[?] (1.) In choosing a new mount, kindly tell me, am I right in supposing that a high compression engine vibrates more than an engine with a low compression? (2.) Likewise, is an engine with a long stroke less comfortable than an engine with stroke about equal to bore? (3.) Would you recommend a twin-cylinder machine on account of its smooth running to a comparative novice, who prefers comfort in riding above all? Am not averse to a little tinkering at home, but not on the road. (4.) Is a clutch worth its place on a machine, or, in other words, is it not better to go one better and have a clutch and two-speed gear or nothing? (5.) Are motor bicycles almost standardised now, or is it likely there will be sweeping alterations in 1909 models? —L. HAWKINS.

(1.) It is generally admitted that a high compression engine is less comfortable in use, although more efficient in many other respects. (2.) Yes, other things being equal. (3.) A good twin-cylinder machine would give you every satisfaction. (4.) A clutch is hardly a substitute for a change-speed gear, but is better than a fixed gear from every point of view except reliability, and there is very little to go wrong. (5.) It is unlikely there will be sweeping alterations in the design of 1909 models, but, of course, there will be small improvements all round.

Carbon Deposits.

[?] I am troubled with pre-ignition. The strange part of it is I have run the machine (M.M.C. engine) nearly 2,000 miles without taking it down, but cannot run it 200 now. The only alteration I have made in the engine has been to rebore 3-32in. larger, and, of course, new piston and rings. The alteration has made the machine more powerful until pre-ignition sets in.—W.H., Beds.

It would appear that you are either using a common grade of lubricating oil, or you have been served with a spurious imitation. Are the piston rings a good fit, or do they allow oil to get past? Pre-ignition is usually caused by an accumulation of carbon deposit on the piston and cylinder head, which becomes incandescent after continuous running, and fires the charge prematurely. If there are any loose particles in the engine or a sharp projection on the casting these would account for the pre-ignition.

Adjustments for Slow Running.

[?] I have a 1907 Minerva 3½ h.p. with magneto ignition. When the machine is on the stand a sharp down thrust on the pedal will start the engine at once, but on the road no amount of running beside the machine will start the engine. I can only get it to start on a slight incline where I can get speed, when the engine will run all right. In traffic, when I wish to run slowly, the engine will cease to work if I drop below a certain speed. The ratio of the gear is 4½ to 1. What is the lowest number of miles per hour the engine will run? I have noticed on the stand slow pedalling will not produce a spark.—N. B.

Difficulty in starting is, generally speaking, due to the carburettor receiving too much air at slow speeds. Very often this may be overcome by fitting an auxiliary shutter to partly close the air intake holes, such as that suggested in *The Motor Cycle* of February 12th, page 121. It is quite possible, how-

ever, that in your case the trouble is due to the points of the sparking plug being too far apart or to the magneto contact breaker requiring adjustment. The gear of the machine seems too high; 5 to 1 would be better. You should then be able to throttle down quite comfortably to six to eight miles an hour.

Stretch of Exhaust Lifter Wire.

[?] I had a Bowden exhaust lift fitted to my machine a few months ago, and when going downhill with the exhaust lifted to its fullest extent there are still slight explosions. Also when starting I mount the machine and pedal away, but find that I cannot get the speed up necessary for a prompt start, which is annoying at times. The engine runs well after the exhaust lifter is dropped. How would you remedy this?—F. L.

The wire must have stretched or leverage in the first instance was not sufficient, and the valve is not being lifted sufficiently to release the compression. It is not a difficult matter to take up the stretch by the nuts provided, or any motor cycle agent would do it for you.

Premature Firing.

[?] Some time ago I asked your advice re my single-cylinder engine, which continued to fire after switching off the engine. You told me to scrape away the carbon deposits on the piston and cylinder head, which I did, and the trouble is cured to a great extent; but now after running for some time and getting the engine very hot, if I switch off there are occasional backfires, although the engine is clean. Is it a defect of some engines, and will it do any harm?—C. F.

It is a defect of some engines to continue firing after switching off the ignition, but it can sometimes be cured by a change of sparking plug, as with some plugs the points become incandescent through the great heat. A sharp projection in the casting of the cylinder would also cause premature firing. If when stopping the engine you close the throttle as well as switch off, further explosions cannot occur.

Opening of Automatic Inlet Valves.

? (1.) What is the most efficient method of setting the amount of lift? (2.) Given two valves with equal springs A with $\frac{1}{2}$ in. lift, B with $\frac{1}{4}$ in., would they work evenly with the same suck from the piston? I have always held the opinion that it has been found that motor cycles run much faster now than before, chiefly owing to the fact that it has been found that by fixing the amount of the lift to a very small degree higher speed can be obtained, and for some years have found this to be the case. I am now told by a friend that I am wrong, and that with a lift of, say, $\frac{1}{2}$ in. the piston will only suck open the valve as far as is necessary. The machine in question is a $3\frac{1}{2}$ h.p. surface, and I suggested that by regulating the lift of the valve to about $\frac{1}{4}$ in. greater speed could be obtained. Surely two valves one with unlimited lift, and the other with, say, $\frac{1}{4}$ in., would not work equally.—H.M.

(1.) The most efficient method of setting the lift of the inlet valve is to use washers of various thicknesses until the correct results are obtained. (2.) If you put valves with different openings in each cylinder of a two-cylinder engine you would soon see that the result would not be the same. It is best to have a small opening and a fairly large valve, then the same amount of gas is drawn through, as in the case of a small valve and big lift. A large lift means excessive wear, liability of breakage, and a slower running engine.

Restoring Compression.

? The compression of my 3 h.p. engine is not so good as it was a year ago, although I have carefully ground in the valves and fitted new washers under the valve caps and compression tap. It will not bear my weight on the pedal more than a few seconds, so I am inclined to the opinion that the piston rings are leaky. Would you advise me to fit one or more new rings, and would this be likely to restore compression? At the first attempt I could not move the top ring.—B.E.

You can test whether the valve caps are leaking by spreading oil all around the joints and then standing on the pedal against compression. If bubbles appear you will be able to locate the leakage. If the joints are quite tight the weak compression must be due to faulty rings or to a scored cylinder. It is usually possible to tell if the rings are leaky by the temperature of the crank case, which will be very high if gas is escaping past the rings. The faulty rings themselves will also have black marks at the point at which they allow the gas to pass. Renew all the rings if they have not a bright surface all round, and good compression will return when the rings are properly worked in. The easiest way to remove piston rings is to get three strips of tin and put them at equal distances inside the rings, when they can be slid off. Do not expand the rings more than necessary, as, being very brittle, they will easily break.

Wiring a Twin-cylinder Engine.

? I have done away with the trembler coils on my twin-cylinder motor bicycle, owing to the frequent adjustment necessary, and am fitting a single non-trembler coil in their stead. A make and break contact breaker is already fitted, and I have had the shape of the cam altered to suit the plain coils. Please tell me how to wire up the coil to the engine, as I always carry two accumulators coupled together through a two-way switch. There are four terminals on the coil.—W. B.

Connect B_1 and B_2 of the coil to the two sparking plugs. P+ of the coil should be connected to the two-way switch, the other two switch terminals being connected to the positive terminals of the accumulators. The negative terminals should be connected to the frame,

“seizing.” When a bearing seizes it means it becomes so hot that the expansion is unequal, and the axle or other part jams in the bush. If this is the case the seizure is a permanent stoppage, and can only be put right in a repair shop. If you will let us have a few more details about your trouble we will endeavour to help you. If you think there is some binding in the engine, do not use it again until it has been dismantled and the cause of the trouble found.

READERS' REPLIES.

Even Firing of Both Cylinders.

I notice “In Doubt” is in difficulty with one cylinder of a twin Minerva misfiring when cold, and the healthy cylinder seems to receive too much oil. In my own case the back cylinder is the one that keeps clean; the front one

A motor bicycle and sidecar for the Mexican Post Office. Several machines similar to the one illustrated above have been supplied by Laurin and Klement to the Mexican Post Office, for the collection and transport of letters. The engine is a 4 h.p. single cylinder, air-cooled, and drives by means of a chain through a change-speed gear. The engine has a surface carburetter and low tension magneto.

as also the two trembler blades. A wire from C_2 of the coil should be connected to each of the platinum pointed screws on the contact breaker.

Excessive Quantities of Oil.

? About four weeks ago my $2\frac{1}{2}$ h.p. Ariel began to seize, and still continues to do so. I give it about three or four pumps of oil every fifteen to twenty miles. This amount of oil seems to ease it at times. I have had one broken ring, but the piston seems all right, and shows no sign of want of oil. With giving it such a lot of oil the plug requires cleaning about every seven or eight miles. I use Vacuum B Mobiloil. The rings fit well in, and are not at all pressed out by grit. The engine seizes mostly when travelling about twenty-five, but does it at fifteen miles an hour about every 220 yards, and I immediately give it about half a charge.—M. D., Lincs.

We do not think that you are quite conversant with the meaning of the term

soots up. However, I imagine it is too rich a mixture, and not oil, that is causing the trouble. I have fitted a plate with holes corresponding with holes in extra air inlets, taken out balls (carburetter G. and A.), and control this plate by a Bowden wire from the handle-bar. I found that the front cylinder would take more air than the back. The throttle was very loose, so I made a new one (barrel pattern), and filed the throttle opening for rear cylinder, so that it gives a trifle more gas than to front cylinder when throttled down. Perhaps this difference in openings does not exist, but since one opening has been enlarged both cylinders start off evenly. I find a tight fitting throttle and a hand controlled extra air inlet a great improvement. The machine will fire evenly at walking pace when warm; gear 4 to 1. I should advise “In Doubt” to try cylinders separately on the stand, and notice if one will fire on less throttle than the other; if so, the cylinder that requires more opening should have the throttle port filed out slightly.—N. H. MAY.

RECENT PATENTS.

An Electrically-driven Tricycle.

This construction is intended to be applied to tricycles. The forward portion of the frame A is forked as shown at B, and mounted within the fork is an electro-motor C, the axis of which is in the same plane as that of the steering wheel D. The drive is transmitted from the electro-motor to the wheel D by means of a telescopic, universally-jointed spindle E, through bevel gearing F. The wheel A is supported from the frame by laminated springs G, and it is to allow of relative motion between the wheel and electro-motor that the driving spindle E is made telescopic. Steering is effected through the medium of a tiller H, and, although the specification gives no information on the point, the source of electric supply is presumably arranged in the rear part of the vehicle.—C. Lassen, No. 4,181, 1908.

Valve Mechanism of Twin Engines.

The two exhaust valves A and B are operated by the same cam C through the medium of lifting levers D and E. The cam C is formed integral with the larger half-time wheel F which is driven by the wheel G. The acting portion of the cam C may take the form of an anti-friction roller H, and the ends of the rods J and K which lift the valves may be

provided with anti-friction balls. The free ends of the lifting levers D and E are rounded off, so that the cam C may lift them in the event of the engine rotating in the wrong direction.—J. A. Wade, No. 19,430, 1907.

A PATENT PISTON RING.

A SAMPLE of a new patent piston ring has reached us from James B. Petter and Sons, of Yeovil, which is suitable for motor cycle engines. Reference to the illustrations of the S.P. ring, as it is called (see figs. 5 to 8), will show that, although it is bored eccentrically, in order to obtain approximately uniform normal pressure, as in other types, this boring cut is confined to the centre of the ring, and forms an eccentric groove in its interior circumference, leaving the sides untouched. Owing to this, the side-wearing surface is uniform, whereas with the ordinary type of piston ring Messrs. Petter point out that the side-wearing surface of the ring is reduced for a part of its circumference, and wear takes place both on the ring and in the ring grooves of the piston (figs. 3 and 4). They also point out that a twisting effect is produced by the reciprocating action of the piston, causing the sharp edges of the ring to rub both upon the ring grooves and upon the surface of the cylinder, and undue wear results. Moreover, in the ordinary type of piston ring, after being bored eccentrically (see fig. 1), the section near the joint is weak, and

accidental breakages are liable to occur whilst removing the piston rings. The section of the S.P. piston ring near the joint is strong, and consequently resists

all the tendencies to set up distortion, so that unnecessary wear both upon the ring grooves and upon the surface of the cylinder is prevented.

SEATS YOU DON'T GROW TIRED OF!

BROOKS "SPRING SEAT."

BROOKS "B. 100."

These two models have satisfied thousands of motor cyclists. The method of construction on scientific anti-vibratory principle, combined with the choicest of leather tops, make these seats great favourites with all experienced riders. These reliable seats ensure comfortable riding with the minimum of vibration. Our *Saddle Manual* describes them. Please ask for copy.

The Saddle Specialists (Dept. 45,) BIRMINGHAM.

"HUNTS" Great Annual Sale. Enormous Reductions. Great Slaughter of Prices. Sale sheet free.

LAMPS.

Our celebrated 4½in. lens mirror motor cycle lamp, complete with generator and tubing. Sale price 18/11, usual price 27/6. Lamp only, with back or side brackets, sale price 14/3, usual price 19/9, postage 6d.

The F.H. separate generator lamp, with bull's-eye lens, size of front 6in., glass 4½in., lens 2½in. Burning capacity, 4 hours. Sale price complete 13/11, usual price elsewhere 21/-, postage 6d.

The Hunt tricarburetor lamp. Height 9in., front 4½in. Sale price 7/3½, usual price elsewhere 10/9, postage 6d.

Special purchase of electric side lamps, fitted with bull's-eye lens, complete with cable and bulb. Sale price 13/11 pair, sold elsewhere 25/-, postage 8d.

200 electric tail lamps complete with cable and bulb. Sale price 5/3½, sold elsewhere 9/6, postage 4d.

TYRES.

Very special offer of genuine Continental Covers. Sizes 26 or 28 x 2. Sale price 14/11, usual price 25/-. Sizes 26 or 28 x 2½. Sale price 15/11, usual price 30/-, postage 8d.

Groste steel studded covers. Sale price 26 x 2, 27/6; 26 x 2½, 34/3; 26 x 2½, 39/11. Carriage 1/-

LYCETT TOOL BAG.

Large and roomy. Contains two inside pockets for spares, and two outside pockets for oilcans. Size, 9½in. x 5in. x 4½in. Sale price, 6/8½. Postage 6d.

MOTOR CYCLISTS' CONVEX LENS MIRROR.

Enables the rider to see what's behind him, and, what's more important, the police trap. Fitted on handle-bar. Made on ball joint so that it can be adjusted to any angle.

Adjustable in height.

Sale price, 3in face, 4/11. 4in face, 5/11. Postage 4d.

THE LATEST ALL-RUBBER GOGGLE.

Containing one set plain and one set smoked glasses. Sale price, 2/3½. Postage 2d.

HANDLE-BARS.

25 pair, extra long, with 1in. or ½in. stem. Sale price 7/6½, usual price 12/6. Postage 8d.

CARRIERS.

The Hunt, extra strong, 17in. x 8in., with leather straps. Sale price 4/6½, usual price elsewhere 6/6. Postage 8d.

TEST LAMPS.

5,000 complete in case. Sale price 10½d., worth 2/-.

PLUGS.

1,000 Mica. Sale price 10½d. Genuine Oleo 1/4. Genuine Magneto 2/11½. Postage 2d.

MOTOR CYCLE BOX SPANNERS.

Six sizes with tommy. Sale price 2/3½ set. Postage 3d. Quality guaranteed.

MOTOR GLOVES.

500 pair best Cape tan gauntlets. Sale price 4/11½ pair, usual price 7/6. Postage 4d.

These are only a few of the bargains to be had at our depot. If you cannot call, send for sale sheet (post free).

"HUNTS" (Motor Dept.), 104, Newgate St., LONDON, E.C.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London (20, Tudor Street, E.C.), by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

A SPLENDID CHOICE

of SHOP-SOILED and SECOND-HAND MACHINES, such as NO OTHER FIRM IN THE WORLD can offer.

SINGLE CYLINDERS.

TRIUMPH, 1907, magneto, overhauled and re-enamelled	£30 0
TRIUMPH, 3 h.p., accumulator ignition, perfect	£20 0
ROC, 1908, two-speed, magneto, 4 h.p.	£33 0
N.S.U., 1908, magneto, 3½ h.p., shop-soiled, £40 machine	£30 0
N.S.U., 1907, spring forks, Roc two-speed gear	£28 0
REX DE LUXE, 1908, two-speed, 3½ h.p., shop-soiled	£35 0
F.N., lightweight, magneto, spring forks	£20 0
ROC, 1907, magneto, clutch, spring forks	£19 0
WARWICK, 1908, shop-soiled, two-speed, clutch, magneto, spring forks, £50 machine	£31 0
QUADRANT (Birmingham), 3½ h.p., spring forks	£15 0
SINGER, 3 h.p., magneto, belt drive, Mabon clutch, perfect order	£15 0
WHITLEY, 3 h.p., spray carburetter, girder forks	£7 0
ROYAL ENFIELD, M.O.V., vertical, lately re-enamelled, etc.	£10 0
MINERVA, 2 h.p., spray carburetter, M.O.V.	£6 0

TWINS.

N.S.U., 1908, magneto, 4 h.p., shop-soiled, £50 machine	£39 0
BROWN, 1908, shop-soiled, 5½ h.p., two-speed, Palmer tyres, cost over £67	£45 0
VINDEC, magneto, spring forks	£25 0
ROC, 5 h.p., Peugeot engine, magneto, clutch	£24 10
KERRY, 5 h.p., two-speed	£16 0
REN TOURIST, 5 h.p., magneto, spring forks	£25 0
REN, 5 h.p., spring seat, spring forks	£17 0

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE

NO

NEED TO HURRY HOME

for fear of lamp troubles when you are equipped with the 1909

"ELECTARY" ACETYLENE PROJECTOR.

You fix it on your lamp bracket and there it stays month after month, always ready, always to be depended upon. Quite apart from its refinements (such as the adjustable focussing device which alters the character of its light to suit all riding conditions, its clip locking arrangement, and its method of fitting the divided front glass in a separate metal bezel, thus preventing any rattling, or tendency for the glass to turn round), it is built of a proper gauge sheet brass, and no expense has been spared in procuring for it the title of **MODELE DE LUXE**.

With special generator, polished brass 30/-
With special generator, nickel-plated 31/-
Without generator, polished brass 22/6
Without generator, nickel-plated 23/6

THE FEAR OF STOPPING.

Do YOU know it? Every time you stop, whether it is to make an adjustment mend a puncture, take a photo, or have tea, how you long to hurry off again **IN CASE YOUR ENGINE BECOMES COLD AND DIFFICULT TO START**. This awful feeling is the one thing that spoils the enjoyment of your runs, isn't it? There is a cure—

WHITE'S ECONOMISER

(PATENT APPLIED FOR).

It costs but 4/-, and is fitted to your carburetter in half a minute. When fitted, you can be quite certain of **AN INSTANT START AT ALL TIMES AND IN ALL WEATHERS. INVALUABLE FOR THE COLD WEATHER. INSIST ON HAVING ONE.**

WHERE ARE THOSE SPARES?

Surely I strapped that belt on the handlebar, or was it on the front forks, back stays, or where? Anyhow, it's gone now, and just a new one to-day. Again, that spare tube is ruined through jolting about in my toolbag. I keep my tools and spares in a proper toolbag—why not my belt and inner tube?

The "ELECTARY" ALL-LEATHER COMBINED TYRE & BELT CASE

is what you have all been waiting for. The neatest, best designed, and most valuable accessory ever introduced.

PRICE only 6/6, complete.

W. & R. JACOBS,
Electrical Engineers,
39c, King William Street,
London, E.C.

TRICARS FOR SALE.

Have **YOU** tried
the new Road-
clearer for bicycles?

TAMBOURONG

Replaces the old-fashioned bell and horn.

The Effect is Startling!

Fixes on front forks. A cord from handle-bar pulls trigger when required in contact with front wheel spokes and sounds like a noisy drum or gong.

Stamped metal gong, 1/6.
LEO. RIPAULT & CO.,
64a, POLAND ST., LONDON, W.

Sole Agents for the genuine Parisian made article.
NOTICE. As we find the parchment model is detrimentally affected by damp weather we have abandoned this pattern in favour of the new stamped metal gong, which is the thing for Motor Cycles, and made specially strong.

BOOKS FOR
MOTOR CYCLISTS.

"THE AUTOCAR" AUTOMOBILE DICTIONARY, by Sigmund Krausz. Twelve thousand technical terms and other words employed in connection with automobiles and automobilism. In English-French-German, French-English-German, and German-French-English. Cloth bound. Price 3/6 net. Post free, 3/9.

"USEFUL HINTS AND TIPS FOR AUTOMOBILISTS."—Third edition (revised and enlarged). Contains nearly 600 hints and "wrinkles" relating to the care, management, and repair of automobiles. As useful to the motor cyclist as the car owner. Price 2/6 net. Post free, 2/10.

"MOTOR REPAIRING FOR AMATEURS," by John Henry Knight. A book written to assist those who have a penchant for mechanics, and keep their machine in running order themselves. Price 2/6 net. Post free, 2/9.

Order, with remittance, should be sent to
ILIFFE & SONS LTD.,
20, Tudor St., LONDON, E.C.

Raws and Sons, Indiarubber Manufacturers, Oldhall Street, Liverpool.

The R.O.M. Tube.

"The car tube in miniature."

In order to meet the demand for a tougher and heavier motor cycle inner tube than at present on the market, we have decided to introduce the "R.O.M." (red) tube.

We make this tube in one weight only, viz. "extra heavy."

The highest quality Para rubber alone is used in its construction, and the tube is in fact a heavy car tube in all but size.

Prices, complete with valves.

ADVANCE Adjustable Pulley is not one of the best, but the best on the market.

ENGINES, Engines, Engines.—3 h.p., 6 h.p. and 9 h.p., air or water-cooled; send for particulars.—Address below.

HERE at Last!—An ideal and adjustable belt fastener; price 2s. 6d. — Address below.

ADVANCE Generator Brackets, as recommended by "Ixon"; price 2s. 6d. Advance Motor Mfg. Co., Ltd., Northampton.

CETYPHOTE coil, accumulator, Griwell brake, volt amp meter; 7s. 6d. each.—91, Southfield Road, Chiswick.

BOOTH.—Forecar Attachment, side stay brakes, £4 10s., or take sidecar; wanted, sidecars, give new £8 8s. cycles, level exchange.—Booth's Motories, Wade Street, Halifax.

JACKETS, Overalls, latest style, double texture, waterproof, windproof, best value in the trade, overalls 7s.; jacket double breasted, 14s.—Manufacturers, 35 and 37, Chestergate, Stockport.

THREE-SPEED Free Engine Pulleys, positive, reliable action, most simple to fit, light, neat, durable, no end thrust, guaranteed, patent applied for.—New Nonpare Motor Fittings, Ashtree Road, Stirchley, Birmingham.

7 FT. 3in. 3in. Lycett's Lyso Rubber Belt, 8s.; 3½ h.p. Longuemare carburetter, nearly new, 12s.; large horn, 2s. 6d.; large headlight, with separate generator, 9s.; 28in. by 2in. Dunlop tyre, beaded, 7s.—7, Blair Grove, Southport.

PREMIER Searchlight, complete, unused, 25s.; 9ft. 6in. Stanley-Dermatine, 3in. as new, 12s.; Rich tube, 26 by 2½, good, 9s. 6d.; Jane's magneto cut-out and wire, 2s. loud horn, 2s. 6d.; Lycett toolbag, 2s. 6d.—No. 1,034, The Motor Cycle Offices, Coventry.

FOR Sale, cheap, or exchange, new 26 by 2½ beaded cover, Salisbury Blieriot carburetter, 2½ h.p. engine, Lloyds free engine, clutch, brand new pair of tricar hubs, Hummer carburetter, F.N. ditto, Singer tank plain coil.—Particulars, A. Moyse, Kessingland.

WHY Buy another lamp? Let me fit you with a projector plano-convex lens; 3in., 3½in., 3¾in., 1s. 9d.; 3¾in., 2s.; 4in., 2s. 6d.; 4½in., 2s. 9d.; 4¾in., 3s.; 4¾in., 3s. 6d. 5in., 4s.; satisfaction guaranteed, or your money returned.—Payne, Metchley Lane, Harborne.

2-60 and 1-30 tooth by ½ chain wheels, new 8s. each; 10ft. 3in. by 3in. Renold chain and half links, not run 50 miles, 1s. 6d. per foot; Longuemare carburetter, for 8 h.p. engine, 16s.; brand new radiator, 32ft. of 3in. copper tubing, £2.—41, Kingston Road, Leicester.

5 h.p. Twin Castings, part machined; 3½ h.p. Quadrant cylinder and valves; new 3 h.p. Quadrant tank carburetter; exchange for following: single magneto Phoenix forecar, back wheel, or 26 by 2½ tyres; best cash offer.—Hall, 14, Westville Road, Shepherd's Bush.

GEAR Box, three speeds, direct drive, £5; De Dion 4½ and 6 h.p. valves, nickel, 3s. 6d. and 4s. 6d., also Darracq and Aster; also several carburetters and commutators, from 10s.; leather jacket, 6s.—Eclipse Engine and Motor Co., 255, Earlsfield Road, Wandsworth. Phone: 1,135, Putney.

8-10 h.p. Two-cylinder Engine and Gear Box, four artillery wheels, 700 by 85, four covers, 700 by 85, sound for re-treading, smart two-seated body, with toolbox, hind, painted green, ready for varnish, four new mudguards, with brackets, lamp brackets, for head and side lights, new pressed steel frame sides, up-to-date radiator and bonnet; quick sale, £23.—Carter, 46, Stanley Street, Preston, Lancashire.

SOME USEFUL ACCESSORIES.

(Continued from page 816.)

Coaster hubs have been a standard feature on many pedal bicycles for years past, but have not been popular on standard makes of motor bicycles. In America the New Departure coaster hub is largely used on motor bicycles, and in the case of machines unprovided with footrests there is no doubt that a coaster hub will attain a certain measure of popularity in this country. The New Departure coaster hub for motor bicycles, which we illustrate herewith, is a speciality of BROWN BROS., LTD., Great Eastern Street, E.C.

Brown Bros.' coaster hub for motor cycles.

It combines a free-wheel and back-peddalling brake. The act of back-peddalling imparts movement to a clutch which expands a triple brake ring. The free-wheel is devoid of ratchets, pawls, springs, or rollers, and a machine fitted with it can be wheeled backwards without the brake being applied. The illustration shows the chain ring cut for 1in. pitch block chain, but it will be supplied for 1/2in. pitch roller chain.

That there are numerous inefficient coils on the market is apparent to anyone who takes the trouble to enquire as to the usual amount of current consumed. Knowing this to be the case the CITY

IGNITION Co., 14, Spencer Street, Goswell Road, W.C., have brought out a separate condenser which can be fixed next to the battery, under the coil, or anywhere in close proximity to the coil. The size of the condenser is 5in. x 2 3/4in. x 1 1/4in., and with its aid an ordinary wasteful coil can be rendered one of the most economical in current consumption.

The CONTINENTAL MOTOR Co., who are chiefly famous for their R.O.M. synchronised contact breaker, have brought out a front wheel stand, which is to be known by the same name. The stand is fitted to the ends of the front wheel forks, and, being set eccentrically, allows the legs to be spread out, thus giving great rigidity. The legs are also set past the centre, so that there is no possibility of the machine being accidentally pushed off the stand. The stands are provided with ball castor ends, so that when the stand is down the machine can be wheeled about without the front wheel being in the forks, if so desired. The legs are kept in position

R.O.M. Front Wheel Stand.

Some Useful Accessories.—

by means of spring bolts. A similar stand is also supplied for the back wheel.

ALFRED DUNHILL, LTD., Euston Road, N.W., make a special point of considering the wants of motor cyclists, especially as regards clothing. The Dunhill waterproof leg overall is one of the best garments of the kind on the market. The annexed illustration clearly shows the construction of the article. We have had a pair of these in use for about two

A neat overall sold by Alfred Dunhill, Ltd.

Dunhill's valise for attaching to the carrier.

years, and have found them absolutely indispensable when riding in wet weather. They seem to be practically impervious to moisture, keeping the trousers perfectly dry and amply protecting the boots. Among the many other articles of interest stocked

by this firm may be mentioned a neat valise, designed to be attached to the back carrier of a motor cycle.

The handle-bar switches sold by A. H. HUNT, 115-117, Cannon Street, E.C., have been improved during the last few months, and are worthy of attention from those readers who are contemplating the fitting of a switch—a useful article at all times, but particularly when it is desired to coast downhill without the engine firing and without closing the throttle. The H.H. handle-bar switches now have a clip which is bolted through the solid ebonite body. This form of clip allows the switch to be fixed on the top tube of the frame also, where there is usually very little

Two neat ebonite switches sold by A. H. Hunt.

clearance between the tube and the top of the petrol tank. This is the usual position selected for two-way switches. The contact lever is now fitted with a projecting piece forming the switch lever. In the old type a groove was provided, which often allowed the thumb to slip past the lever. A new addition consists of a removable screwed plug, as shown on the left-hand switch in the illustration. When this plug is unscrewed, the switch is inoperative, so that if the lever should happen to be turned to the "on" position by an unauthorised person the batteries are not affected until the plug is replaced. Another useful article sold by

Mr. Hunt is a safety fuse for attachment to the handle-bar. This is useful in the case of machines provided with a plain coil, as if the rider forgets to switch off and the blade of the contact breaker happens to be making contact, the battery is prevented from discharging itself through the coil, by the fusing of the special alloy.

We have hitherto referred to the combined generator bracket and tank clip marketed by the ADVANCE MOTOR MFG., Co., Louise Road, Northampton, and we now illustrate this useful fitting. It will be seen that it is provided with an adjusting piece situated under the arch of the clip. This can be set with the aid of the screw and lock-nut on the top, in any desired position to suit various diameters of top tubes, and the various spaces existing between the top of the tank and the top tube.

The Kerry adjustable engine pulley has special features of its own. The loose flange and the locking ring are both provided with left-hand threads, as also is the extended boss upon which the loose flange is screwed. Between the

flange and the locking ring is a washer, which is prevented from turning by two dowels or keys which slide in grooves machined in the boss. The amount of adjustment is considerable, and the pulley will take practically any width of belt. It is made to suit the axle of any engine, and the EAST

LONDON RUBBER CO., Great Eastern Street, E.C., claim that the pulley can be adjusted to any gear required in thirty seconds, without the use of tools, except to loosen the locking ring.

For a long time MESSRS. LAKE AND ELLIOT, of Braintree, have enjoyed a high reputation as manufacturers of specialities; their motor cycle stand in particular has been deservedly popular. They have now marketed a lightweight pattern stand, scaling only three pounds, yet equal to hard work. The stand is normally held out of action by a simple spiral spring. To bring it into position the rider has merely

The "Millennium Express" Stand for motor bicycles weighing up to 120 lbs. It weighs 3 lbs.

to apply pressure with his foot and pull the machine back on to the stand. As it is attached to the back stays, the rear wheel of a motor cycle to which it is

Some Useful Accessories.—

fitted can be removed while the stand is in use. It is made of steel throughout, and the lugs are made from Millennium castings. The stand is finished with two coats of stoved enamel, and well plated as to its bright parts.

The number of enquiries we receive regarding the purchase of a reliable speedometer for motor cycles is quite surprising, proving that this accessory, in a simple and moderate priced form, is a general favourite. A. W. GAMAGE, LTD., Holborn, E.C., have prepared for the demand, and among recent importations from the States is the Bullard speedometer for attachment to

The Bullard Speedometer, showing method of driving the flexible shaft.

the handle-bar. It is operated by means of a gear wheel attached to the front wheel spokes and a flexible shaft. Among other advantages claimed for it are the indicating needle is steady at all speeds and yet sensitive to the slightest change. It also has the fewest parts of any instrument of the kind on the market. It is handsome in appearance, compact, and the working parts are provided with ball bearings throughout. Very shortly Gamage's will have the same instrument made up embodying a mileage recorder, for which, of course, an extra charge will be made.

In outward appearance the De Beer's petrol economiser is very similar to the ordinary type of carburetter jet, though somewhat larger in diameter. It has already proved its worth when fitted to the carburetters of industrial vehicles and pleasure cars, and experiments we have carried out have served to convince us that equally good results may be obtained with it when fitted to a motor cycle. From the accompanying sketch it will be seen to consist of the gun metal tube A closed at one end and screwed internally at the other end to take the adapter B. The latter is drilled through the centre, and can be made to suit various types of spray carburetters. The hollow chamber inside A contains a loose fitting piston C, which has two spiral grooves—of course pitch—cut on the outside, and a slot on its lower end to take the blade of a small screwdriver, so that it may be readily ground on to the small seating D seen near the top of the tube A. A hole E is drilled in the domed end of the tube A, and is of unusually large diameter. During the suction stroke of the engine the petrol is drawn up the adapter B, and the spiral grooves of the piston C, causing the latter to slowly rotate against the seating D. It passes through the hole E, and leaves it in the form of a whirling spray. The rotating action of the piston not only atomises the petrol, but tends to check any rush of liquid consequent on a sudden increase in speed of the engine, which would otherwise obtain too rich a mixture; it also prevents the hole E from becoming choked. The machine we tested was fitted with a Brown and Barlow carburetter, and the improvement in economy of consumption was equal to seventeen miles to the gallon. A decided increase in power was also noticed on the level and on the hills. The address of the makers is 432, Mansion House Chambers, Queen Victoria Street, E.C.

(To be continued.)

"THE AUTOCAR" LECTURES.

THE first three lectures of the course of eight lectures on the motor car, arranged by *The Autocar*, have now been given in London, and one in each of the centres named in the next column. It will interest our readers to know that the remaining lectures still to be given in each centre cover the ground of which particulars are given below:

SECOND LECTURE.—Modern Steam Cars—Boilers—Generators—Engines and Regulation—Physical and Chemical Properties of Liquid Fuels—Combustion—Otto Cycle Indicator Diagrams—Two-stroke Engines.

THIRD LECTURE.—Generally speaking, will deal with the engine and all the component parts thereof—Crankshafts—Connecting Rods—Pistons—Valves—Cams—Shafts—the Shape of Cylinders and the Position of the Valves—with some remarks on Motor Cycles.

FOURTH LECTURE.—Clutches: Cone, Expanding, Metal-to-metal, Disc, etc.—Gear Boxes—Cardan-shafts—Universal Joints—Back Axles.

FIFTH LECTURE.—Carburation—Cooling and Lubrication.

SIXTH LECTURE.—The whole of this lecture will be devoted to various forms of ignition, particular attention being given to High-tension Distribution Systems, and Magnetos.

SEVENTH LECTURE.—Frames—Steering—Brakes—Bearings—Chains, etc.

EIGHTH LECTURE.—Bodies—Wheels—Tyres—Accessories—Hints on Driving—Organisation.

The dates of the remaining lectures in each centre are as follows:

LONDON.—November 3rd, 10th, 17th, 24th, and December 1st. Each day at 3.30 and 8.30 p.m.

BIRMINGHAM.—To-day (Wednesday), November 4th, 11th, 18th, 25th, December 2nd and 9th. 7.30 p.m.

LEEDS.—October 29th, November 5th, 12th, 19th, 26th, December 3rd and 10th. 7.30 p.m.

MANCHESTER.—October 30th, November 6th, 13th, 20th, 27th, December 4th and 11th. 4.0 and 7.30 p.m.

NEWCASTLE-ON-TYNE.—November 2nd, 9th, 16th, 23rd, 30th, December 7th and 14th. 7.30 p.m.

We draw special attention to the fact that to meet the wishes of those of our readers who may wish to attend four of the remaining five lectures in London and seven lectures in each of the provincial centres, arrangements have been made to issue tickets to admit to any four of the lectures for 10s. 6d. Applications for tickets should be made immediately to the Lecture Secretary, 20, Tudor Street, E.C.

Mr. Crole-Rees called at our office one day last week and showed us an interesting electric lamp which will shortly be placed on the market by Messrs. Bowen and Odery Mfg. Co., Pomeroy Street, New Cross, S.E.

IS THE TRICAR DEAD?

A REPLY BY "AB 29."

IN reply to the above question, I enclose a photograph of a special local built light tricar which is very much alive, and the following facts and deductions—the result of seven years' driving of various machines—will confirm your leaderette in a recent issue.

Now as to what the machine can do and has done. The last run of any magnitude was on August 11th with a ten-stone driver, ten-stone passenger, and three-quarters of a hundredweight of luggage (a complete camping-out equipment). The machine travelled with this load eighty miles in four and a quarter hours. The course was through many towns, and included stopping to purchase petrol, a tyre pump, dinner, taking wrong turnings, getting over the Chiltern Hills, travelling about twenty miles along the top of the Cotswold hills against the wind, and through a storm of rain. All this was done in four and a quarter hours on a $3\frac{1}{2}$ h.p. air-cooled tricar, driven by the writer.

The machine can be relied upon to average twenty or twenty-one miles per hour. It can just manage when loaded the hill between Broadway and Stow-on-the-Wold—a mile and a-half of 1 in 11. This is about its limit for hill-climbing without dropping the passenger. It has run over four thousand miles, is running on the original tyres, and with the original belt. It has been stuck up on one occasion only, and that through an exhaust valve breaking.

Distribution of the Weight.

The following details of the machine may be useful to those contemplating the purchase of a similar machine. The frame was specially built to my own ideas. I had found the back wheel on a previously owned tricar skid very much or waggle when travelling through grease. This I put down to insufficient weight on the hinder part of the machine, and it was so light that my usual method of turning round was to pick up the back wheel with one hand and walk it round without any exertion whatever. The present frame was so designed that the weight of the fore-carriage and passenger came *behind*, instead of in front of, the front axle, as is more usual. Then, again, you will see there is a box on each footboard near the back wheel. These boxes contain tools, batteries, and coil. The difference in weight is so great that with two hands and feet firmly braced I can only just manage to lift up the back wheel and move it a few inches at a

time. The running of the machine justifies the alteration of design, for I have never known the machine to skid, and I take "grease" at full speed now.

So much for the frame; now for the engine. The power is obtained from a $3\frac{1}{2}$ h.p. Fafnir engine, 80 by 80 mm., fan cooled. The engine was reversed so as to have the valve box facing towards the front to catch the air. The fan was my own design and make, and runs on ball bearings, driven by one of Terry's spring fan belts at about 4,000 r.p.m., and is in every way satisfactory. I have run without the fan, but find that for even a short hill I need to wait about five minutes for the engine to cool down. The engine has the Fafnir two-speed gear and free engine attached to it. This gear has not even been inspected, let alone adjusted, during its 4,000 miles' working, so I consider it fool-proof. A similar gear on the first tricar ran even longer than this without adjustment. The best of all the good points in this gear is the fact that the belt pulley is *twice* the usual size, and runs at half the speed of the engine. The bugbear of belt slipping round a small diameter pulley is done away with, and, as an adjustable pulley has been fitted, any gear can be got between $4\frac{1}{2}$ to 1 and 9 to 1 on the high speed, with the corresponding low gears of $6\frac{3}{4}$ and $13\frac{1}{2}$ to 1. The belt is a $\frac{7}{8}$ in. Whittles link-grip, and has done over 4,000 miles. Another thousand miles will see the end of it, but this is a splendid record.

Tyres—and Tyres.

The tyres are $2\frac{1}{2}$ in. Palmer Cord, with a rubber puncture-proof band inside between cover and tube. These tyres have worn remarkably well. All three wheels have the same size tyres, and all three tyres have been on the back wheel in turn, and they are now on the second turn round. Neither has yet shown the need of retreading. The tyres are always kept up hard—in fact, harder than is comfortable. As for punctures, the only time I have ever stopped for a puncture was when a clock wheel spindle went through cover, band, and tube. I had another make of tyre—and a reinforced one, too—wear down to the canvas in less than 500 miles on a previous tricar.

A word or two about minor fittings may not be out of place. The machine has long, rubber covered, brass bound footboards, and these are found very comfortable and convenient for the "running mount."

The engine has a starting handle, but I prefer to give one push on the low gear, and off it goes.

For winter riding a pair of plated brass wind shields are screwed on to protect the feet. The tank is made of one piece of sheet steel, with the seam on the top. It holds two gallons of petrol and three pints of oil, with a *double* partition, soldered and riveted, between. The ends are recessed, soldered and riveted, and a baffle plate in the petrol portion is likewise fixed in. In fact, the tank would stand quite a respectable steam pressure if tested. It has oil and petrol gauges, which are "worth a guinea a box"—I mean each. The filler caps are as large as a five-shilling piece, and at most garages I hear the remark, "That's something like a filler, that is." A very small petrol filter is fitted under the tank, and

Is the Tricar Dead?—

the "lovely view," as a Birmingham lassie called it one Sunday night, obtained by looking through the jet when obstructed is seen no more. A flexible petrol pipe is now fitted after breaking two rigid copper ones. Several "cone" joints, metal to metal, have been done away with, and leather washer joints substituted. These can be made petrol-tight with very much less screwing up and straining of parts. The control is by a small Bowden lever on the handle-bar (working the throttle), and the spark lever is on the tank. The two-speed gear lever is on the top tube; when pushed forward we get the high gear, backwards the low gear, and when upright the free engine. The clutches are metal to metal, and revolve in an oil bath.

The machine is braked by a pedal operating a large band brake on the back wheel, and the pedal is so placed that it can easily be stood on to give greater power. There are also a pair of band brakes on the front wheels operated by a powerful side lever. The saddle is Brooks's latest spring seat, and is found to be very comfortable. The wiring is encased in thick indiarubber pipe for protection, and the high-tension lead passes through a celluloid tube made from a discarded tyre inflator. The coil is a non-trembler of good make, and the original platinum contact breaker points are still in use. I have no wish for a current-consuming, platinum-devouring trembler coil while I get such good results from my non-trembler.

The lamp brackets, specially designed, project above the lamp sockets, and have a tapped hole in which a

padlock can be inserted or a quarter-inch screw screwed in, to prevent the lamps being stolen or jolted off. In the toolbox is a small plate, size to carry an ordinary cycle lamp, which can be screwed to the lamp brackets, so as to be able to carry a borrowed cycle lamp when the proper lamps are forgotten or for some reason are unusable for the time being. A small electric lamp is also carried to be run off the spare ignition battery for inspection purposes, but it has not yet been used. The locker in front of the seat should prove a useful buffer in an end-on collision. This idea was in view when this pattern was chosen.

The engine pulley supplied by the makers of the Fafnir is too large for a tricar. It gives gears of $4\frac{1}{2}$ and $6\frac{3}{4}$ to 1, and only the most level of roads can be travelled with such high ratios. About eleven thousand miles have been covered by the writer with this size of engine, who finds that from 6 to 7 to 1 are the most suitable gears, with corresponding low gears of 9 and $10\frac{1}{2}$ to 1. Over-heating? Not a bit of it. Oil every ten miles; and always run down hill with the ignition off, to cool the engine. After a mile of full throttle on the low gear on a 1 in 11 rise, the engine will take the high gear as sweetly as on the level, and knocking is unknown.

Those who want an economical passenger machine, and are content to run at, or near, the legal limit, cannot do better than invest in a light tricar. To be a success, it must be light (and not a small car on cycle wheels), be belt-driven by a suitable belt, have a two-speed gear and a free engine.

A NEW MODEL ZENETTE.

MESSRS. ZENITH MOTORS, LTD., although they have found their spring frame model to have been a great success, have turned their attention to the production of a lighter rigid frame model, suitable for those riders who are willing to sacrifice a slight degree of comfort for a little extra speed uphill.

The machine which we have under consideration is a really sound job, and from the short trial we were able to enjoy in the dual capacity of both witness and participant we expect it to meet with considerable success. It will be seen that, as in the case of the spring frame Zenette, the top tube is sloping, thus giving the rider a low saddle position, and we must congratulate Zenith Motors, Ltd., on utilising the sloping tube, long ago obsolete in cycle practice, in order to obtain this end.

The machine is fitted with an 85 by 85 mm. $3\frac{1}{2}$ h.p. m.o.v. engine, gear-driven magneto, Longuemare carburetter, handle-bar control, Druid spring forks, and Gradua gear—that most ingenious contrivance the excellent working of which we can vouch for personally after an extensive trial.

The motor bicycle is shown on the one in six portion of Swain's Lane, Highgate, one of the steepest hills in the London area. It twice ascended the hill in excellent form, and restarted on the gradient from a standstill without the slightest effort. In the saddle it is most comfortable, and after a short ride we found it

to be easy to control, fast, and a good hill-climber.

The Gradua gear has now been before the public for some months, and the makers have been wise enough to enter machines fitted with the gear in this year's long

F. W. Barnes starting from standstill on the steepest portion of Swain's Lane Hill (gradient 1 in 6). His left hand is on the operating wheel of the Gradua gear.

distance trials—the End-to-end Run in particular—and it emerged with flying colours.

THE 1909 B. AND B. CARBURETTER.

CARBURETTERS and their details are always of interest to motor cyclists, because a good carburetter which provides a uniform mixture enables an engine to be easily started, and is not too sensitive, renders a machine a joy and pleasure to its owner, whereas a bad carburetter, *i.e.*, one that, however it is adjusted, causes difficulty in starting, and is constantly flooding, giving too rich a mixture, etc., is just the reverse of pleasant. The B. and B., made by Brown and Barlow, 16 and 17, Loveday Street, Birmingham, has been on the market for several years, and is acknowledged to be one of the best carburetters it is possible to obtain for motor cycles. Early this year the firm adopted handle-bar control in a neat

The 1909 pattern Brown and Barlow handle-bar controlled carburetter.

form, and for next year the details have been still further improved over the one last described and illustrated in these pages.

In the 1909 model the jet has been made to come out from the underside, simply by unscrewing the nut N at the base of the spray chamber. Provision for the adjustment of the two cables is also made by the two screws J J at the top of the spray chamber. The ends of the cables are protected by metal sleeves, and the nuts J J being conical and split, they grip the sleeves tightly when screwed into the top of the carburetting chamber. The coiled springs have been increased in length over last year's pattern, consequently providing increased elasticity. The valves C and D are held in position by the oval adapter L, as they slide down between the walls of the chamber and the outer edge of the adapter. To dissect the spray chamber portion, all that is necessary is to loosen the two nuts J J at the top, when both cables can be pushed through and the throttle and air valves disengaged from their respective wires.

Among the improvements in the float chamber are the lid or cover which is now pressed, the guide for the needle being a separate piece of metal nutted to the lid by the bracket or carrier for the balance weights.

This carburetter is, of course, made for single and twin-cylinder engines. The single-cylinder model is

illustrated, a different top to the carburetting chamber being supplied to suit a twin engine.

We have had a considerable amount of personal riding experience with the B. and B. handle-bar controlled carburetter, and have found it gives most excellent results. We have no hesitation in recommending it with every confidence to all sections of our readers.

A GOOD REPAIR.

A few weeks ago Messrs. Tufnell and Co., 527, High Road, Leytonstone, N.E., asked us to place at their disposal a motor cycle engine which required rebushing and cylinder grinding out and fitting with new piston, in order to give us a real idea of the quality of their work. Complying with their request, we sent them a 3½ h.p. Brown engine which has been in constant use for about two years, during which time it has covered about 8,000 miles. We are pleased to say that the engine has been returned to us perfectly overhauled, and is quite in its old form again, pulling as well as it did when new. The piston is splendidly fitted in the cylinder, as also are the new bushes. There is a very slight amount of play on the big end of the connecting rod, but as this bearing is provided with a steel bush which must have a fair amount of clearance for oil, the amount of play at this point is necessary.

Questions... and Replies.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Storing an Accumulator.

? Will you please inform me how to clean and dry an accumulator so that I can put it away during the winter?—W.W.M.

The best thing to do is either to charge fully and then to wash out the accumulator thoroughly two or three times with clean water, fill up with clean water and put vaseline on the terminals, or to run down completely through a four-volt lamp, wash out, drain, and vaseline the terminals.

Altering the Air Supply.

? How can I give my $3\frac{3}{4}$ h.p. N.S.U. more air. At present it can take all the extra air with throttle only about a quarter open, and consequently I have not the power I think this machine should give.—A.P., N.B.

All N.S.U. carburettors are fitted with movable air slides on the side and back of the carburetter, in addition to an extra air controlling valve on the top of the tube, which stands above the top tube. If you make these holes larger by moving the outside perforated plate you will be able to admit as much air as necessary. Do not make the openings larger than necessary, or you will render your machine more difficult to start.

Misfiring at Speed.

? (1.) My 1907 Triumph (magneto) misfires when it has got up to a speed of about 20 m.p.h. if I have the spark lever fully advanced. I bring it back a notch and it is all right. Why is this? Timing wrong? (2.) My engine won't take all the air allowed, no matter how far I open the throttle. In fact, engine misfires altogether if I open throttle more than half-way, whether I give little or much air. Why is this?—E.J.H.

(1.) Most probably the contact breaker of the magneto is worn. The parts most likely to wear are the platinum points, the ball head of the steel piece holding the movable platinum point and the fibre ring. If you replace these probably the trouble will vanish. (2.)

Perhaps when you have remedied the ignition you will be able to give more air, when the engine will run faster. Also, you had better take down your carburetter and see if the jet and petrol pipe are clean; this also might account for the fact that the engine will not take the right quantity of air. Also test the level of the petrol in the jet.

Timing of Magneto and Pre-ignition.

? I have a 5 h.p. twin-cylinder motor bicycle. After the engine has been running for a few miles it starts knocking when I advance the magneto lever, and does not stop until I retard it about half-way. If I slow down at a corner and then advance the spark to pick up it knocks very badly. The same thing happens when I mount the machine and the engine is warm. The gear is about $3\frac{3}{4}$ to 1. Is it too high? I can only get about fifty-five miles to a gallon of petrol. Is it right to advance the spark lever fully to start? The carburetter is an A.M.A.C. The machine is a new one. I may say that the engine starts very easily and pulls very well up hills, and when I run it at full speed with the spark lever fully advanced there is no sign of a knock. After I have been running for about forty miles, and then cut-out the magneto, it keeps on firing until I close the throttle or use the brakes. Kindly explain the cause?—J.S., Sheffield.

Your engine is probably timed too fast, and for starting and ordinary running you must keep the lever slightly retarded, and advance it gradually when gathering speed. Carbon deposits on the cylinder and piston would also cause the knocking, likewise bad oil. You do not mention your weight. A gear of $3\frac{3}{4}$ to 1 is certainly rather high for winter riding; 4 to 1, or slightly lower would be advisable. Generally speaking, the magneto has to be practically fully advanced to start, but some makers time their engines faster than others. The fact that the engine continues firing when the magneto is cut out shows that it gets far too hot, and pre-ignition occurs.

Cylinder Packing and Lift of Valve.

? (1.) Would you kindly inform me if there is any packing or washer required for my $2\frac{3}{4}$ h.p. M.M.C. engine between the crankcase and cylinder? If so, what thickness would it need to be to give the proper compression ratio? (2.) The exhaust valve barely lifts 3-16in. There is no wear on the cam, and just the proper clearance between tappet and valve. Do you think it will be correct?—R.R.

(1.) The packing in question is, generally speaking, brown paper soaked in boiled linseed oil. This is to prevent the oil leaking out. (2.) Such a small thickness should not noticeably affect the lift of the valve, but should you notice any loss of power grind in the exhaust valve, which will improve the compression, and lengthen the stem sufficiently to make up for the difference. The exhaust valve should open $\frac{1}{4}$ in.

Timing a Twin-cylinder Engine.

? Kindly assist me in the timing of a 6 h.p. twin J.A.P. I had the engine down recently, and in the assembling I timed the exhaust valve to close just after the piston had turned, instead of dead on top as usual. I did this, as the exhaust valve opens very early indeed probably owing to the abnormally long stroke, with the idea that the velocity with which the exhaust gas is expelled would continue to clear the cylinder after the push of the piston had ceased. By moving one tooth back I can, of course, close it dead on top. In view of the long stroke do you recommend me to close the valve dead on top?—R.W.

First make sure if the timing gear is marked, as it certainly ought to be, and set it according to these marks. If it is not, you had better follow the accepted rule and get the valve to close when the piston is dead on the top of its stroke; then test the engine for running, and if it is not giving its original power set the valve to close one tooth back. The more lead you give to exhaust the faster engine will run, but it may not pull so well.

The Life of Dry Batteries.

?

I am about to convert my motor cycle from accumulator to dry battery ignition with trembler coil. On looking through some back numbers of *The Motor Cycle* of last year I saw a letter from a gentleman stating that he had used a Hellesen dry battery in connection with a plain coil with very good results, as he could get from 800 to 1,000 miles of running on a battery, but a friend of his who used one with a trembler coil could only get about 350 miles out of it. Was this in your opinion due to a faulty coil, or would a trembler coil be so much inferior to a plain coil for dry battery ignition?—J.L.H.

Owing to its wastefulness a trembler coil can only be used with a dry battery for a very short time, as the battery soon becomes exhausted. If, however, a good plain coil is used, it will allow the dry battery to be run for some considerable time.

An Underpowered Tricar.

?

I have a 2½ h.p. motor tricar, and lately have had trouble with overheating. I have had two wind funnels fixed which are very satisfactory, but there is still room for improvement. Do you think if I had a larger exhaust pipe fixed it would do any good? The present one is only about ¾ in. bore, and nearly 3 ft. long to silencer. Also the engine knocks at times, not always when running fast, and then without any alteration is quiet again. What would be the likely cause?—E.B.W.

A larger exhaust pipe would enable the burnt gases to escape more freely, and would tend to keep the engine cooler. The knocking you complain about is due to overloading the engine. Either the gear is too high for the little engine, or ignition too far advanced. If it occurs at intervals and not when the machine is very hard worked, it points to carbon inside the cylinder becoming incandescent and causing pre-ignition.

Preventing Leakage of Oil.

?

Oil oozes out at two places between the two halves of the crankcase of my engine. What is the best way to rectify this?

I notice that oil also creeps up along the exhaust valve tappet and escapes in rather considerable quantity. Can you suggest a remedy? Does the increase of pressure within the crankcase as the piston descends cause any escape of oil from it if it is properly made? Can you tell me of any device whereby this increase of pressure could be diminished or avoided? I have connected the crankcase by means of a tube with an additional oil chamber open to the air by a small opening, and from which the oil can be drained away as it collects. Do you think that such a device will interfere with the lubrication of the engine? I find that it does not prevent the leakage above-mentioned in any marked degree.—OIL.

Some crankcases have no packing between the halves, depending solely on a perfect fit to prevent leakage of oil. If

your engine has a brown paper joint, make a new packing, soaking the brown paper in boiled linseed oil. The fact that oil escapes through the exhaust tappet hole seems to indicate that the bush is worn. Another cause for oil escaping to an excessive degree is that the relief valve does not work properly, causing an extreme amount of pressure inside the crankcase. If you fit an extra relief valve it should help to remedy the trouble. Thin oil will leak at most joints. If you are using thin oil try a thicker grade. If you will send us a sketch of your device we will give you our opinion on it. Personally, we think it should not be necessary.

Cannot Attain Speed.

?

I am having considerable trouble with my 2½ h.p. Centaur, and from the following facts I should be glad if you can give me any assistance. The compression is good, also the ignition. When on the stand, with half gas and half air, the engine will respond to the sparking lever up to

Accumulator Charging and Compression

?

Am I doing right by charging my accumulator by connecting it to a tumbler switch which controls eight 32 c.p. lights? The current is continuous and 220 volts. The charging rate of accumulator is one and a half ampères for twelve hours at five volts (this is a little beyond me). The accumulator gets fully charged in about five hours, and the celluloid gets very warm (almost hot), and the liquids inside gas very profusely. I stood on the pedal of a new machine recently and the compression was so good, I believe I could have stood upon it for an hour before the pedal would go down. Now mine is just the reverse. If I stand on my pedal it will go down in about two seconds. The valves are an accurate fit, having just been ground in (inlet a.o.v.) and the piston rings are new and a good fit, and the slots are in their proper places, about a third round from each other, and yet the compression is bad. I can go at a splendid

A motor cycle street sweeper. Last week (page 825) we briefly described the above three-wheeled machine, which was exhibited at the International Road Congress in the Tuileries Gardens, Paris, where it attracted considerable attention.

great speed without any sign of misfiring, also when running very slowly, but as soon as I mount the machine on the road and advance the spark with the same amount of gas and air the engine immediately fails and finally stops. Have tried different mixtures of gas and air when riding, but the engine will not respond to the sparking lever after being advanced half-way.—L.T.

We think you will find your trouble is due to the reduced lift of the valves. Either the cams have worn or the distance between tappet and valve stem is too great. The proper clearance is 1-32 in. A new exhaust valve spring would also improve matters. The carburettor very likely requires cleaning. Also examine the contact breaker and see that this is working properly.

rate on the level, but uphill I have to pedal. Engine about three years old, 2½ h.p. De Dion pattern. Inlet valve opens about 3-32 in.—C.S., Birmingham.

If you remove four or five of the lamp you will reduce the charging rate to about one and a half ampères. The fact that you have fitted new piston rings may account for the compression being poor. The cylinder and piston of your engine are probably worn out and require replacing. Also try and see if you can detect any leak between the inlet valve dome and the seating into which it fixes in the cylinder, the seating of the sparking plug, and around the compression tap. Oil or soap suds spread over the joints will locate the place of leakage for you. The leaky washers should be replaced with new ones.

MUDLARKING ON A LIGHTWEIGHT.

By B. H. DAVIES.

LONG distance riding against time becomes a dubious business when October is near. However fond one may be of "breakfast runs" in summer, they are less agreeable when darkness only begins to fade towards 6.30 a.m., and when its departure is too often blurred by lingering fogs; at the day's other end the lamp is needed sooner in practice than by law, and the law calls for it as early as 7 p.m. After grease and mud all day, one has little stomach left to face a mixture of mire, gloom, fog, and drizzle after the evening meal, and so I felt rather dubious in planning the double journey from Northampton to Durham and back for a four days' leave in the last week of September.

When it came to the point, my first free day (a Monday) opened with such a downpour that I hadn't the pluck to start till 4 p.m. A little Douglas romped me into Newark by lighting up time very comfortably indeed, and I had meant to push on to Doncaster for the night, but the fog deterred me, and I stayed at the Clinton Arms instead. I arose most virtuously in time to start north again at 7 a.m. on the Tuesday, only to find a most grey and "parky" fog greeting me outside the hotel—a fog which soon changed into a steady downpour. This rain, added to volleys of mudclogs from the ploughed-up roads, set up chronic slipping in both my rubber belts, with the result that I did not reach Durham till 6.30 p.m. Wednesday, again, was wet and misty, and Thursday opened ditto, so I preferred to return ingloriously by train, and my planned test ride of 440 miles degenerated into a mere 220. This distance, however, proved ample to bring out the manifold excellences of the little $2\frac{3}{4}$ h.p. Douglas twin. A better machine for mud-plugging no one could possibly desire.

No Signs of Side-slip.

When I left Northampton the roads were more greasy than muddy, and I never like facing grease on a strange machine; but within a few miles I was remorselessly outraging legal limit, inspired by a sense of absolute security. The balance of the machine is good, and a low geared horizontally opposed engine is devoid of tug at the rear wheel; moreover, this wheel was shod with a basket tread Continental, which clung to its track as rigidly as a ring of iron spikes, so that all nervousness on this score soon evaporated. Beyond Stamford the roads were dry, though pot-hole, and fast time was made into Newark (seventy-five miles). By the way, it is sad to see those in charge of a great national highway like the North Road content to tackle pot-holes by shovelling in a barrowful of coarse metal, and plastering mud on top of it. As previously stated, I meant to dine at Newark and push on to Doncaster afterwards in the dark, but threatening whorls of grey fog deterred me, and I took a bed at the Clinton Arms. Sallying forth at seven next morning I was greeted by a very thick mist, which soon became tinged with a fine drizzle, and presently diluted itself into a horrid, penetrating downpour, lasting the entire day. I had two rubber belts with me, both in excellent order, but neither of them could withstand the combined attacks of rain from above, and wet mud from

below. They slipped and slipped and slipped, until tightened so that they almost bound the pulleyside bearing of the engine, and even at that exaggerated degree of tautness they would only pull on the flat. As soon as a grade as contemptible as 1 in 100 was struck, or even if the engine were rapidly accelerated on the level, they utterly declined to grip the engine pulley. I could not test its groove for wear without detaching the external flywheel, but over and over again I longed for one of my own trusty leather Watawatas. Luckily the North Road is distinctly flattish, and when a hill was encountered I could always get up at about eight miles an hour by keeping the spark retarded and the throttle almost shut, while lending hearty assistance with the pedals. In this fashion I progressed in great misery, mud flying all round me, water running almost audibly down the small of my back, and trickling in torrents off my cap. The machine plugged along as if the roads were dry, never slowing to less than twenty-five miles an hour on the heaviest level going except at my command, and only prevented from storming up gradients by the treachery of the belt. The magneto sparked away merrily for the whole of that awful 140 miles except on one occasion. Here the road was practically under water, and I met a great Daimler car, spurning the pools in great fan-shaped swirls from all its wheels.

Trouble with the Belt.

After it was passed, the machine was simply one huge damp clod of wet earth, and I was ditto. I propped it up, and plunged my hands into it cast away great fistfuls of mire; then I scooped off minor encumbrances with a screwdriver, and finally seeking shelter under some handy trees polished it up a little with some dry rags, after which it sparked once more. I tried every conceivable device for making the belt grip; swapped it for a new one, mopped out both pulleys, cleaned and dried the sides, tightened and tightened and tightened, but all to no purpose, till at Doncaster I realised it would slip till the roads dried up.

Hereabouts I noticed a lane with a signpost "To York," and decided to take the main line train at York. The lane presently became a mass of wet, slithering leaves, but as the Douglas stood up, I persevered; it then turned into a canal for a hundred yards, but as the engine continued firing I swished on through the water. Then it began to rise, and simultaneously the grass invaded it, and gradually lengthened, till it was knee deep. I turned back, and went on towards Boroughbridge. At Boroughbridge events proved that the age of miracles is not yet past. Kindly notice I had wasted hours trying to humour the miserable belt south of Doncaster. Since Doncaster I had abandoned it hopelessly to its evil ways. Well, from Boroughbridge onwards it gripped like a chain running in an oil bath, and I again began to make my average look respectable, with the result that I safely reached my destination some miles nor'-west of Durham without recourse to the railroad. Who can explain these caprices of india-rubber?

My appreciation of the little Douglas after such a

Mudlarking on a Lightweight.—

trying ride was naturally profound. Few magnetos are so entirely waterproof. Its position high up on top of the crank case has doubtless much to do with this. The little engine swallows all its own vibration, for I never once felt any tremor from it, and it pulled like a good 'un through the frightful mire. The belt-slip is possibly explained by the fact that the pulleys had been through the End-to-end and the Plymouth runs. The steering is delightful, and the brakes sound; the rear wheel is fitted with a coaster hub, which type of brake is very conveniently actuated in combination with footrests; the top pedal lay against the calf of my leg, when my feet were on the rests, and could be powerfully applied by simply stiffening the calf muscles against the pedal. The control is good, consisting of a tank spark lever, a thumbscrew air

A MOTOR CYCLIST'S FOUR SUCCESSES.

UNDoubtedly the most successful rider of an F.N. four-cylinder motor bicycle during 1908 is R. O. Clark, of Norwich. He has entered this machine for several of the most strenuous and searching tests organised for motor cycles, with no small amount of success. In the M.C.C. London to Edinburgh run he was a successful competitor, also completing the return journey in schedule time, thereby winning the double journey gold medal. He followed up this success by winning the ten miles handicap race for touring machines at the Essex M.C. race meeting at the Stadium. In the Tourist Trophy Race he finished third in the multi-cylinder class, his average speed being $37\frac{3}{5}$ miles per hour, whilst his consumption was at the rate of 90.8 miles per gallon

R. O. Clark and his four-cylinder $4\frac{1}{2}$ h.p. F.N.

—the lowest in his class. Mr. Clark's fourth success was in the last Brooklands handicap race (October 3rd), when he gained second place.

adjuster, and a handle-bar trigger throttle. I noticed the carburetter was not delicately adjusted, as the machine would start and run with the air lever in any position whatsoever, while the throttle control had a critical point reminding me of passing from the chest voice to the head voice in singing—i.e., there was a point of setting, before which it was weak and beyond which it was strong, without much delicacy of range. I found the Druid spring fork in combination with the well-balanced engine to produce a vibrationless machine. The wheels and rims are very strong indeed, and in conjunction with heavy-treaded $1\frac{3}{4}$ in. tyres leave nothing to be desired. This machine apparently does not rank in the 80 lb. class, as the sample submitted to me for test weighed 144 lbs. in full touring kit. This mount is a most comfortable and reliable machine, especially adapted to winter riding.

A NEW CYCLE COUPLER.

THE latest type of coupler is shown in the annexed illustration. It is called the Telco, and is made by a company of the same name, whose temporary address is 147, Shooters Hill Road, Blackheath, S.E. The coupler is attached to and detached from the motor cycle and cycle by a simple twisting movement of the main tubes, the ends being

The Telco Cycle Coupler in use.

held in a patent bayonet joint, which we hope to describe in detail at a later date. The joint allows the machines to be telescoped on the main tubes of the coupler, so that the combination can pass through a narrow doorway without uncoupling. The illustration shows a standard $2\frac{1}{2}$ h.p. Fairy coupled to a strongly-built lady's bicycle, the combination making a rigid four-wheeled vehicle. We understand that it has been tested for several thousand miles. It is claimed by the makers that there is no tendency whatever to side-slip, and that the position of the riders is more companionable than on a tricar or sidecar. The weight of the attachment is about 12 lbs.

WORLD'S

**OVER 70 MILES
COVERED IN AN HOUR!**

At Brooklands, on October 8th, Mr.
C. R. Collier, riding a 10 h.p. twin-
cylinder "Matchless" fitted with

THE MOTOR CYCLE LIBRARY.

Useful Books for Motorists and Motor Cyclists.

"THE AUTOCAR HANDBOOK."

A Guide to the Motor Car. How to select, maintain, and drive an automobile. Well illustrated.
Price 1/6. Post free 1/9.

"THE AUTOCAR LOGBOOK"

and Motor Cyclists' and Cyclists' Record. Containing list of Agents who stock petrol, competent repairers, list of hotels, mileage, and maintenance records, and other information useful to autocarists, motor cyclists, and others. Morocco case, elastic band, back loop pencil.
Price, post free, 3/2.

"USEFUL HINTS AND TIPS FOR AUTOMOBILISTS."

Indispensable to Motorists. How to cure, or what is better still, how to prevent road troubles. Third edition (revised and enlarged) now ready.
Price 2/6. Post free 2/10.

"MOTOR REPAIRING FOR AMATEURS."

By John Henry Knight. Invaluable to those who have a penchant for mechanics, and prefer to keep their car or motor cycle in running order themselves.
Price 2/6 nett. Post free 2/9.

"MOTOR POCKET BOOK."

By Mervyn O'Gorman, M.I.E.E., Assoc. M.I.M.E. A pocket volume for constant reference. Bound in limp leather. Rounded corners. Illustrated.
Price 7/6 nett. Post free 7/9.

"THE AUTOCAR' AUTOMOBILE DICTIONARY."

By Sigmund Krausz. A collection of twelve thousand technical terms and words employed in connection with motor cars and motoring in three languages—English, French, and German. Strongly bound, and printed on linen-faced paper, which will not tear or fray with constant handling.
Price 3/6. Post free 3/8.

"PETROL MOTORS SIMPLY EXPLAINED."

By T. H. Hawley. Price 1/- nett. Post free 1/2.

"PRACTICAL MOTOR CAR REPAIRING."

By Eric H. Walford. Price 1/- nett. Post free 1/2.

"THE COMPLETE MOTORIST."

By A. B. Filson Young. Being an account of the evolution and construction of and maintenance of the same, and on the pleasure of the modern motor car, with notes on the selection, use, and travel upon the public roads. Bound in cloth.
Price 12/6 nett. Post free 12/10.

"PETROL MOTORS AND MOTOR CARS."

A Handbook for engineers, designers, and draughtsmen. By T. Hyler White, A.M.I.M.E. With numerous illustrations
Price 4/6 net. Post free 4/9.

THE MOTOR CAR REGISTER."

A diary and record of mileage ; petrol expenses, with yearly summary ; also forms for tyre register ; capital accounts ; list of accessories, insurance details, etc., to which is added a copy of the "Motor Car Act," a list of Town and County index letters, and a speed reckoning table. Bound in leather, with pocket for inserting licence. Price 3/- nett, post free 3/3.

All the above books may be obtained
by post if ordered (with remittance) from
"The Motor Cycle," Offices, 20, Tudor
Street, London, E.C.

OCCASIONAL COMMENTS.

By "IXION."

Automatic Variable Pulleys.

Quite a number of brains appear to be busy with the automatically variable pulley just now. In addition to Mr. Lloyd's patent, described on page 785, I have heard of two during this year. One was Mr. Holt-White's oil pressure system, by which the engine pulley not only contracted and expanded automatically, but also simultaneously worked a jockey pulley or "idler," as they call it in America, which automatically took up the slack of the belt. Again, in the Lutterworth district, there is a home-made sidecar running about, fitted with an automatic pulley working by a spring, and very similar to the Lloyd idea. It will be a great boon to us all if Mr. Lloyd's device is found suitable for all conditions, as it will render two-speed gears unnecessary for solo work on all machines of 3 h.p. and upwards.

Twins in The T.T.

Some riders have expressed surprise that the fastest twin was slower than the winning single. They fail to realise that on the flat a $3\frac{1}{2}$ h.p. single can keep up with a 5 h.p. twin. If the conditions are not so unfavourable that a great deal of power is absorbed in overcoming wind and road resistance, maximum speed is very largely a matter of engine revolutions. A twin and a single can both attain an engine speed in the neighbourhood of 2,500 r.p.m. If they are equally geared, as is often the case, and the conditions are so favourable that the extra 2 h.p. of the twin is not required very pressing, both machines will do a flying mile in nearly equal time. In the T.T. the further question of a limited supply of petrol comes into operation, and there is little doubt that the twins were slightly more handicapped proportionately than the singles in this respect. Were the petrol consumption unlimited, we should see the twins beat the singles nine times out of ten.

Domed Pistons.

We hear that one or two makers are abandoning the flat-topped piston in their 1909 engines, and substituting pistons with convex heads. I remember several years ago seeing an engine with a concave-headed piston, the idea being that this formation would give a larger area for the explosion to concentrate itself upon, and would also centre the charge better, and prevent so much of it acting by rebound from the walls of the combustion chamber. This design was soon abandoned by the designer referred to, though I never heard his exact reason. The domed piston (domed in a convex direction) is, I believe, quite a new idea, and if it proves to be a real advance, car designers will no doubt copy it. Presumably its main idea is to reduce carbonisation of the piston head. Whatever constituents are found in piston deposits, and whatever the proportion of these several constituents, the foundation of all such deposits is obviously oil. Neither road dust nor metallic dust could fail to be swept off the piston head by the flames of repeated explosions were it not that the piston is usually coated with a glutinous substance to which they adhere, and that gluten must surely consist solely of oil which has found its way up past the piston rings, whether by suction or capillary

action. The suggestion is that if the top of the piston be domed, convexly less oil will climb on to its head, and what oil does reach the head will be less likely to stay there and form a glutinous coating to which the road dust and metallic scrapings can adhere. It would be interesting to make two tests in one engine, running it first a thousand miles with a flat piston, and then a thousand miles with a

Mrs. Luther Myers, the first lady member of the Bradford Motor Cycle Club.

domed piston, one man driving all the time, and remaining constant to a single brand of oil and a strict rule of lubrication. Any differences in the weight and character of the deposit removed after each test would be very instructive. No doubt the makers concerned have performed these tests, and learnt a good deal from them.

Float Chamber Design.

I find in my notes on an ideal carburetter I scarcely laid sufficient emphasis on certain excellent principles of float chamber design, which are embodied in the Amac, and possibly in others. A reference to the line drawing on page 777 will show that the needle valve is Λ shaped instead of the ordinary V. Consider the operation of this under road shocks. The first bounce of the machine attempts to throw the needle upwards, and only has the effect of holding it more closely against its seat. The recoil tries to jerk the needle down, but the spirit inside the chamber presses the float up against the crossbar of the needle, and so counteracts the effects of the road vibration. In other words, with a V needle valve the pressure of the spirit and the road shocks both act in the same direction—hence the needle is often jerked off its seat and flooding occurs; with a Λ valve the spirit pressure and the road shocks compensate each other, and so flooding is obviated, and no damping device for the needle tip is necessary.

Will Dorset rider who wrote to "Ixion" recently regarding a $1\frac{3}{4}$ h.p. F.N. kindly forward his address?

CURRENT CHAT

TIME TO LIGHT LAMPS.—Oct. 28th, 5.41 p.m.; Oct. 31st, 5.36 p.m.; Nov. 4th, 5.28 p.m.

"The Motor Cycle" Show Numbers.

In connection with the forthcoming Stanley Show, three special issues of *The Motor Cycle* will be published, dated November 18th and 25th, and December 2nd.

Leather Helmets.

Dudley R. Clarke appears to be the only British track rider to adopt the sensible Continental idea of wearing a "casque" or leather helmet, his head-gear being a familiar object in races throughout the season. There is no doubt that the casque affords excellent protection to perhaps the most vulnerable part of the rider in the event of a fall.

Trend of Design in America.

It is regarded as a foregone conclusion in motor cycling circles in America that twin-cylinder motor bicycles will dominate the Madison Square Garden Show, New York, in January next. It is also hinted that three manufacturers who have up to the present marketed only motor cycles with chain transmission will also add to their patterns by incorporating a belt drive.

Motor Tricycles for the Mexican P.O.

We are advised that the Mexican Post Office authorities have purchased a dozen Laurin and Klement motor bicycles and sidecars for carrying mails, similar to the one illustrated on page 831 last week, and appear to be thoroughly satisfied with their acquisition. Generally speaking, the vehicles are identical with the type which has been adopted by the Austrian P.O. The machine propels nearly 4 cwt. of postal matter.

Yankee Ruling Treated as a Joke.

Theodore K. Hastings, of New York, has been transferred to the professional class by the Chairman of the F.A.M. Competition Committee "on account of his competition against professionals in the English End-to-end Run." Hastings came over here after making enquiry and being warned that he would forfeit his amateur status "if he entered the lists with foreign cash takers." English riders will, of course, treat the ruling as a huge joke, and so did Hastings apparently, or he would not have come over. The ruling will not affect him, as he did not intend to take part in any more American competitions.

Motor Cycle Frightens a Horse.

At North Ormesby on Tuesday of last week the inquest was resumed on the man Chas. Peacock, who was knocked down by a horse which took fright at a motor cycle ridden by J. H. Calvert. It appears that the horse did not begin to prance until the motor cycle was about level with it, and one of the men with the horse was sitting on the shafts, and the deceased was at first walking by the side, but not at the horse's head. Mr. Calvert was travelling at six to eight miles an hour, and did not look round after passing, as he thought there was no need to. He knew nothing of the accident until he was told about it afterwards. The jury returned a verdict of accidental death.

The Chateau Thierry Hill Climb.

Chateau Thierry is in the department of Oise, about sixty miles from Paris. The annual hill-climbing contest which took place there on the 18th inst. was a great success. Giuppone repeated his Gaillon Hill performance by making the fastest time on a motor bicycle, and fastest time of any motor vehicle

with the exception of a racing Opel-Darracq car. Giuppone's time on a Peugeot weighing under 110 lbs. was 50 $\frac{2}{5}$ s. Jørns, on an Opel-Darracq with cylinders 121 by 130 mm., occupied 44 $\frac{1}{5}$ s. for the same distance. There were in all six classes for motor cycles, and the Moto-Rève was victorious in two. In the class for machines under 62 lbs. Noel (Moto-Rève) was first in 1m. 31 $\frac{4}{5}$ s., and the same rider competing under the Auto Cycle Club de France category was again first in 1m. 29 $\frac{3}{5}$ s. An Albatross and a Lurquin-Coudert respectively won the quarter litre class in 1m. 45 $\frac{1}{5}$ s. for Class A and 1m. 34 $\frac{2}{5}$ s. for Class B. In the third litre class Giuppone went up in 1m. 6 $\frac{3}{5}$ s. in Class A. A Quentin was driven up in 1m. 24 $\frac{3}{5}$ s. in Class B. In the class for machines over 110 lbs. a Lurquin and Coudert (which won) made 17 $\frac{1}{5}$ s. slower time than Giuppone on a machine under 110 lbs. The Ronteix tricar won the racing class in 1m. 53s. A class for tricars weighing not less than 3 cwt. 3 qrs. 20 lbs. was won by Madame Guerry, who drove a Guerry and Bourguignon.

Giuppone, on a Peugeot, making fastest time in his class at the Chateau-Thierry Hill-climb (France). He was only beaten by 6 $\frac{1}{5}$ secs. by a four-cylinder Darracq racing car.

Police Traps.

A police trap is working between Oldham and Delph, on the main road to Huddersfield.

There is another in operation between Putney and Walton-on-Thames.

Collier V. Olieslagers.

The recent professional Stadium sports and Marathon race were such an unqualified success that it has been decided to hold another meeting next year on an even grander scale. A motor cycle contest between Collier, the British champion, and the fastest European rider, possibly Olieslagers, for a substantial purse and the world's championship, will, in all probability, be one of the attractions. The races will be over short distances.

Motor Union Notes.

At the October meeting of the Motor Union, which was held at the Piccadilly Hotel, W., on the 21st inst., it was reported that seventy-two motor cyclists had joined under the 10s. 6d. subscription and seventy-eight under the 21s. subscription. Among them may be mentioned Mr. M. J. Tuchman, who has been appointed a member of the Motor Cycle Committee, and another well-known cyclist, Mr. S. H. Fry, of Highbury, N. The total receipts of the M.U. for the nine months ending September 30th amounted to £11,906, as against £9,370 for the same period last year.

A Caution.

Motor cyclists journeying through Altrincham, Cheshire, should exercise extreme care not to exceed a speed of about eight to ten miles an hour. The police are very particular about the speed, especially on Sundays during the hours of divine worship. In all cases when motor cyclists are passing through towns and villages on Sundays, particularly during the hours of service, the use of the horn should be avoided as much as possible, and under no consideration should the cut-out be left open.

M.C.C. Closing Run.

The M.C.C. held its closing run to Redbourne on the 18th inst., which was well attended. A detailed report of the meet is published on page 847.

Two Speedy Riders.

The first British rider to cover a mile a minute on a motor cycle stands to the credit of Harry Martin; he accomplished this on the road in the Gordon-Bennett speed trials in Ireland, 1903. To Collier, of course, belongs the honour of being the first motor cyclist in the world to cover seventy miles in one hour.

Auto Cycle Union Notes.

The paper by Mr. Basil H. Davies on the subject of "Tricars—Dead, Living, and Unborn," will be read before the members of the Auto Cycle Union on Thursday, November 5th, and not on

Engines and Magneto Stolen.

Some time during the night of the 21st the premises of Mr. J. Taylor, 318, Percy Road, Birmingham, were broken into and the following articles stolen: One Bosch magneto, DA2L, No. 224.131; one Bosch magneto, DAVL, No. 220.596; one Bosch magneto, DAVL, No. 220.597; one Peugeot engine, 2½ h.p. single-cylinder, No. 17.592; one Peugeot engine, 3½ h.p. twin-cylinder, No. 12.993. Should any reader be offered a Peugeot engine or Bosch magneto bearing one of the above numbers, or similar articles with the number obliterated, he is asked to communicate with Mr. Taylor immediately.

Danger of Loose Handle-bars.

A regrettable accident occurred at Shenstone, Staffs., last week, Mr. Richard Wilcox, of Sutton Coldfield, being thrown from a motor cycle he was riding and receiving injuries from which he died. It is not known exactly how the accident happened, but a witness heard a grating noise and saw deceased fall over the handle-bars, but an experienced motor cyclist who examined deceased's machine gave it as his opinion that the accident was due to the handle-bar stem being very loose in the socket, causing the machine to become uncontrollable.

The Paris Salon.

The President of the French Republic, Monsieur Fallières, will open the Paris Salon on Nov. 28th. All items of interest to motor cyclists will be described and illustrated in *The Motor Cycle* of December 9th.

The Triumph Company's Profits.

It is gratifying to note that the directors of the Triumph Cycle Co., Ltd., Coventry, this year recommend a dividend of seven and a half per cent. on the ordinary shares of the company. This is two and a half per cent. increase over the last two years, and five per cent. increase over 1905.

FUTURE EVENTS.

- Nov. 5—Paper before members of the Auto Cycle Union, "Tricars—Dead, Living, and Unborn," by Mr. Basil H. Davies.
- " 13-21—OLYMPIA AUTOMOBILE EXHIBITION.
- " 18—Motor Union Annual Dinner at the Hotel Great Central, London.
- " 20-28—THIRTY-SECOND ANNUAL STANLEY SHOW, at the Agricultural Hall, Islington.
- " 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.
- Dec. 16—Motor Union General Committee Meeting.
- Jan. 16-23—Motor Cycle Show at Madison Square Garden, New York.

Friday, November 6th, as already announced in the *R.A.C. Journal*. The alteration has been made in order not to clash with the Stanley Club's annual smoking concert, which is to be held on the later date. The paper will be given at the Associates' premises, 112, Piccadilly, at 8 p.m., and this will afford those who have not previously availed themselves of the opportunity to see the excellent accommodation provided for members at this address.

The Motor Cycling Club closing run to Redbourne on the 18th inst. A group of members and friends photographed at the Bull, Redbourne.

Motor Cycling Adventures in Tasmania.

HOME readers of *The Motor Cycle* are always interested to hear of the doings of brother motor cyclists in the Colonies. The following extracts from a most interesting letter, sent by Mr. Cecil M. Dyer, of Launceston, Tasmania, will be sufficient to convince readers what can be accomplished with a motor cycle over the heavy mountainous roads of Tasmania:

"Since July 12th this year to September 12th my mileage table shows 2,829 miles. A careful record kept of stoppages shows that, outside of tyre troubles and sooty plugs (which are merest incidents in a motor cyclist's life), the involuntary stoppages during this period totalled ten, made up as follows:

"Broken porcelain (front plug)	1
Choked carburetter	3
Inlet valve cotter adrift	2
Skid into a road cutting	1
Plunger of Truffault spring unshipping	3	

"The trouble with inlet valves I have since obviated by having valve stems filed up and threaded, two nuts taking the place of the cotter; a much better adjustment of spring tension can thus be obtained. The Truffault fork trouble was caused by driving fast over bush tracks. I fitted two long spiral springs as a rebound check. They act admirably, and are far safer than the set screw at the bottom of head. This sheared off the first time the plunger came unshipped.

"You may perhaps think, in these days of End-to-end non-stop runs, that 2,829 miles, with ten involuntary stoppages, is not a very meritorious performance. On well-made English roads it is not, but under totally different conditions, of which I will give you a brief outline, the claim of the Vindec Special to be 'the motor cycle of merit' is amply justified.

Far Away from Civilisation.

"My vocation as a traveller for a firm who trade in wool, furred skins, and a few other lines, takes me far away from civilisation (as represented by petrol supplies and macadamised roads) often for weeks at a time, petrol supplies being 'cached' at various points. Early in May my wanderings commence amongst the mountainous and heavily timbered districts to the camps and depots of hunters and trappers of opossum, kangaroo, wallaby, and other native animals, whose furs have a high commercial value. Right back into the heart of the Tasmanian forests my Vindec goes, the exhaust often scaring healthy specimens of Tasmanian carnivora, *i.e.*, tiger (or so-called hyæna), and the Tasmanian 'devil' into a most undignified and hurried retreat. Until the end of September, periodical visits are made to these camps and depots, the furs being most valuable in winter time, which is a bad time out here for travelling.

"In three seasons of this work I wore out two motor cycles—not Vindec's though.

"For hours I ride over mere bridle tracks, through bush, scrub, and forest, then over tussock, grass plains, and away over rocky boulder-strewn trails (that's where the Truffault forks get a quilting). Rain, snow, sleet, frost, and ice are often served up as 'trimmings' for these most 'delectable' rides; and when I tell you that after every trip my wheels have to be retrued, dents taken out, and new spoke nipples fitted, you can guess what the frame has to stand.

"Once (when the crate was opened) my machine was a beautiful creation in French grey and black; now, alas! its pristine beauty has vanished, and a coating of mud and clay protects the enamel. But, although the tank is battered and the whole outfit looks the worse for wear, it's only externally; I get there every time, and that's the main thing. If there is another motor cycle in the southern hemisphere gets such a 'doing' as my Vindec, I'd like to meet its rider.

"On the main roads, which are excellent, the pulley is adjusted to give a $3\frac{1}{4}$ to 1 gear, and it fairly flies. Out in the bush and mountain country it is often necessary to lower the gear to the lowest point; then it goes anywhere. Night riding on bush roads is trying for machine and rider alike. The prospect of a 'night out' does not appeal to me; still, at times I have to do some ticklish work by lamplight.

"Notwithstanding the rough usage and adverse conditions under which I work, the Vindec is positively reliable, and has yet to leave me stranded; but I'm not afraid of that very much.

A Bad Sideslip.

"I have some slippery rides sometimes; for instance, on one trip I had to ride over twenty-four miles of greasy soapstone track in two and a half hours. Nineteen times I had to dismount, owing to particularly serpentine movements landing me in the scrub. Sideslip is but a daily happening in the winter, and one soon gets used to it. Once, however, a skid landed me properly; I had to take out Truffault forks and travel per boots seven miles to a farm where I knew a forge was to be had. The suspender bar was set back $1\frac{5}{8}$ in., and would not clear the magneto to turn the front wheel for steering. A couple of hours' work soon put matters right again, and I was enabled to reach camp at Bicheno before dark.

"On another trip through Piper's River country I got bogged. I had to walk a mile or two to a timber camp, and 'humped' back two big sheets of bark (about 14ft. by 2ft.)—as much as I could stagger through the scrub with. When I got back to the bicycle only the forepart was above mud and water; it seemed quaint, and seemed to have touched bottom. I had a job to dig it out, but after making a little 'Brooklands' with the slabs of bark it was a bit easier, and I at last struck solid earth again. It looked a picture! Nothing like that in the End-to-end runs, I hope. A week or two in the Midlands on excellent roads soon recompenses for the hardships, and a bit of good surface is greatly appreciated.

A Tasmanian Sutton Bank.

"From *The Motor Cycle* (which almost all motor cyclists read here from cover to cover and duly appreciate) I should judge Sutton Bank to be a warm climb. Well, imagine a Sutton Bank with but a rough bush track in place of a road, often commencing with a water splash at the bottom, and then you will have some idea of the work my machine does almost daily; you will understand why I'm delighted.

"Fully half the mileage mentioned in the earlier part of this letter has been done in the wildest and roughest parts of Tasmania, the balance being over our good roads. Rain, hail, or snow, I've got to get there, and I do."

Wakefield M.C.

The second reliability trial to Scarborough and back took place on the 18th inst., starting from headquarters. There were nine starters, and five competitors finished to schedule time, namely, Mr. Spivey, Dr. S. Reader, Mr. C. Nicholson, Mr. F. Boulby, and Mr. E. Moore. Mr. Spivey will hold the silver cup, value £10 10s., presented by the vice-presidents, and a gold medal; second, silver medal; 3rd, bronze medal.

Western District M.C. (London).

The result of the petrol consumption test held by the above club on the 11th inst. is as follows:

Rider and machine.	Figure of merit.
1. F. W. Ritchie (5 h.p. Peugeot) ...	9.43
2. W. F. Ritchie (5 h.p. Rex) ...	9.32
3. H. Beech (5 h.p. Vindec) ...	8.04
W. Canham (3½ h.p. London) ...	7.19
A. R. Canham (3½ h.p. Brown) ...	6.70
H. Vowler (3½ h.p. Triumph) ...	6.29
Boxall (3½ h.p. Triumph) ...	6.04
R. King (3½ h.p. Triumph) ...	5.24

The above club held a most successful hill-climb on the 18th inst. Results:

Twin-cylinders: 1, H. Beech (5 h.p. Vindec); 2, F. W. Ritchie (3½ h.p. Peugeot); 3, W. F. Ritchie (5 h.p. Rex); 4, F. H. Mullett (5 h.p. Kerry).

Single-cylinders: 1, W. H. Kennedy (2½ h.p. Ariel); 2, R. Tomkins (3 h.p. N.S.U.); 3, H. Vowler (3½ h.p. Triumph); 4, A. Canham (3½ h.p. Brown); R. King (3½ h.p. Triumph); W. Canham (3½ h.p. London); I. Babbage (2½ h.p. Rex).

On Sunday, November 1st, there will be an inter-club run with the N.W. London M.C.C. Meet at Gerrard's Cross at 11 a.m.

The Worcestershire M.C.C.

On the 17th inst. the above club held its first annual dinner at headquarters, the chair being taken by Mr. C. H. Wakeman, at 7 o'clock. After an excellent repast, the Chairman rose to toast "The King," and then went on to say a few words about the club, complimenting the organisers on the very successful year they had had, and also upon the present financial condition of the club. Other speeches were made by Mr. J. Burgess, Mr. N. C. Polloch, Mr. E. Burgess, (captain), and H. C. Pickering (secretary), after which followed a musical programme, under the direction of Mr. Polloch, supported by Messrs. C. A. Williams, G. Deeley, Baldwin, and Bertram Evans.

Newcastle M.C.

The club opened its winter programme on Wednesday evening last, when Mr. William Dunn (captain) delivered a lecture on "Motor Cycling," illustrated with 148 lantern slides. The lecture was divided into three sections, viz., sporting, recreation, and reliability, and some pertinent references were made to police traps. The North-country motorists have suffered somewhat severely from the tactics of over zealous police officials, and probably the police trap pictures were the hit of the evening. On the screen was shown a comparison of the old and new ways of extorting "dues" on the highway; in the first place showing a highwayman of the real type astride his steed and fully armed, and subsequently portraying the modern "highwayman" lurking behind hedges. Mr. A. J. Lucas (the president) occupied the chair, and there was a large attendance of members and their friends.

The next social event is a Bohemian concert, to be held at the Continental Restaurant, Newcastle-on-Tyne, on December 2nd, at which prizes won during the year will be presented.

The Harrogate and District M.C.C.

This newly formed club held its first speed-judging competition on the 18th inst. The competition was, however, spoiled to a great extent by the inclement weather. Nevertheless, a few sporting riders turned up, and made splendid time over a difficult course of fifteen miles. The winner proved to be J. Mackay (3 h.p. Triumph), he being 3m. under his time; 2, F. Strafford (2¾ h.p. Peugeot), 3m. 59s. under time. The third and fourth were respectively W. Grange (3½ h.p. Triumph and sidecar) and W. Turner (3½ h.p. Triumph). The first prize was a gold medal, presented by Mr. J. A. Tindali; the second prize is valued at 10s. 6d.

The M.C.C. Closing Run.

On the 18th inst. the M.C.C. held its annual closing run to Redbourne, lunch being taken at the Bull, the country headquarters of the club. Fortunately, the weather was fine and the roads good, so that there was an excellent muster, between sixty and seventy members and friends sitting down to an excellent lunch, after which short speeches were delivered by Messrs. S. J. Sewell, W. H. Wells, and A. G. Reynolds.

A photograph was taken at Redbourne (see page 845), and members who would like copies can obtain them from Messrs. Ashworth and Meredith, Clarendon Road Works, Watford, Herts. The price is 1s. each, mounted.

The Stanley Show run will take place on Sunday, November 22nd, and the annual dinner on Saturday, December 12th. Particulars will be sent to members in due course. Arrangements are being made for a series of winter entertainments similar to those held in previous years.

Leeds M.C.C.

This club will hold its first whist drive this season on November 6th at the White Horse Restaurant, Boar Lane, Leeds, commencing at 8.15 p.m. prompt. Numerous valuable prizes will be given, and it is earnestly hoped that a representative gathering will be present. The committee appeal to the members to give them their support this winter to a far larger degree than they did last year, and assure them that they will find the various entertainments provided of first-class quality, and in every way enjoyable. Tickets for the whist drive, price 1s. 6d. each, can be obtained from any member of the committee.

RICHMOND AND DISTRICT M.C.C. CHALLENGE CUP.

The Carpmael Cup, presented by Mr. A. Carpmael, jun.

The President's Cup, presented by the Marquis de Mouzilly St. Mars.

Club News.—

Richmond and District M.C.C.

A committee meeting was held at the residence of Dr. Paul. Kingston Hill, on October 8th, at which the hon. secretary formally handed over to the committee the two challenge cups which have been kindly presented by the president of the club (the Marquis de Mouzilly St. Mars) and the captain of the club (Mr. A. Carpmael, jun.) respectively, and these were presented to the successful competitors. The President's Cup was won by Mr. K. Lankester in a reliability trial of about 200 miles, held on August 15th, and the Carpmael Challenge Cup was won by Mr. F. C. Wood in a reliability trial of about 180 miles, held on July 11th.

It was decided to hold the annual dinner on November 20th next, when the members of the club are invited to meet at the Motor Show at Olympia at four o'clock in the afternoon. After visiting the show, the members will then adjourn for dinner in the evening.

Motor cyclists living in the district of Richmond and Surbiton who are wishing to join the club are invited to write to the hon. secretary, Mr. H. C. King, of Walton House, Surbiton Road, Kingston-on-Thames, who will be pleased to forward full particulars of membership.

Manchester M.C. Invitation Petrol Consumption Test.

A special test took place on Saturday, October 17th, amongst the officials and the first four winners in the car and cycle sections, to verify the distance covered in the last petrol test, in which E. J. Chambers (16 h.p. Bell car) covered a distance equal to 43 car miles and 60 ton miles per gallon; V. G. New (18 h.p. Siddeley), 38.9 car miles and 65.6 ton miles. In the cycle section, J. Tytler (3½ h.p. Triumph) did 192 miles per gallon; J. L. Rose (four-cylinder F.N.), 132 miles; and A. J. Moorhouse (5 h.p. Rex), 131 miles.

Although the day appointed was not an ideal one for a competition of this class, the previous results were easily beaten both in the car and cycle sections.

Special officials were appointed to check the weights and petrol allowance. The petrol allowance was measured out by Messrs. Higginson and Hunt. Inspectors of engines and starters, Messrs. J. Baines and McNeil.

The same twenty-five mile course was chosen, and extra officials were appointed to check the whole of the distance.

In the cycle section, J. L. Rose could not compete, and A. J. Moorhouse (5 h.p. Rex), who won the first petrol test of the year, again proved winner on formula, beating his previous distance by about two and a half miles. C. E. Kettle (3½ h.p. Triumph), who came second, did a distance equal to 198 miles per gallon. It is interesting to note that Mr. Kettle used a White petrol economiser.

Great credit is due to the efficient way in which the whole of the course was checked by Messrs. J. T. Ward, H. Reed, Andrews, and Jones.

Walthamstow M.C.

A non-stop and speed-judging competition was held on Saturday, October 24th, over a course of sixteen miles. Results are as follow:

	Time allowed.	m.	s.
G. Humphreys (5 h.p. Peugeot)	48m.	7	45 fast
W. S. Low (3½ h.p. Rex)	56m.	4	48 fast
J. W. Percival (6 h.p. Fafnir tricar)	56m.	3	3 fast
R. J. Lisles (5½ h.p. Fafnir)	50m.	2	6 slow
F. W. Applebee (5 h.p. twin Rex)	53m.	18	slow
C. W. Lee (3¼ h.p. Rex tricar, 1904)	58m.	10	slow
W. H. Applebee (3¼ h.p. Rex tricar, 1904)	stopped.		

Winners: 1, C. W. Lee; 2, F. W. Applebee; 3, R. J. Lisles.

The remarkable part of this competition was that the first and second competitors were within seconds of the actual time set. No watches were carried, and the competitors did not know the time they started.

Mr. J. W. Percival has been declared the winner of the 100 miles annual dinner cup competition and gold medal.

The annual dinner has been fixed for Saturday, December 5th, at the City Arms, St. Mary Axe, E.C.

Stockport and District M.C.C.

A speed judgment, petrol consumption, and reliability trial was lately organised by this club. The idea was to ride from Stockport to the Cat and Fiddle, *via* Buxton, returning to Stockport *via* Macclesfield, making a distance of forty miles, which had to be covered at sixteen miles per hour. The time each competitor left Stockport was recorded, also the time each rider arrived back, making a deduction for the stop allowed at the Cat and Fiddle. It will be interesting to note that all the competitors exceeded the speed limit allowed.

Each competitor started with the same number of marks, namely: Speed, 150; reliability, 100; petrol, for every ounce remaining in the tank at the finish, 10 marks. Deductions: 10 marks were deducted for any stop. Speed: A deduction of 1 mark was made for every minute below or after the time allowed.

Results:

CLASS 1.—Single-cylinder machines.

	Total marks.
1. W. Slater (3½ h.p. Triumph)	1627.5
2. E. W. Wheeldon (3½ h.p. Triumph)	1511.0
3. F. Briggs (3½ h.p. Midget Bicar)	1464.0
4. H. Swain (3½ h.p. Rex)	1259.5
5. F. Allen (2½ h.p. Peugeot) retired.	

CLASS 2.—Multi-cylinders.

1. R. Rogers (4½ h.p. F.N.)	1425.0
2. W. C. Norman (5 h.p. Rex)	907.25
3. J. Woodrow (5 h.p. Rex)	519.5
4. H. Marsden (5 h.p. Rex) retired.	

At the meeting held on Wednesday last, it was decided to hold the first annual dinner on December 4th, at the Mersey Hotel. Tickets, 4s. each, may be obtained of any members of the committee.

THE ENCYCLOPÆDIA OF MOTORING.

THE latest edition of this work on motoring is a handsomely bound volume consisting of 672 pages of descriptions and illustrations of the detail working parts of motor cars, many parts of which also apply to motor cycles, notably the chapters on change-speed gears, carburetters, ignition, internal combustion engines, two-stroke engines, etc. On page 357 a short article is devoted to the motor bicycle and passenger motor cycles. "The Encyclopædia of Motoring" will be found most interesting to any motor cyclist who is thoroughly interested in the mechanism of the machine he rides, and also aspires to knowledge regarding other vehicles he meets on the road. Armed with a copy of this book, and from the knowledge already gained from the manipulation of his own machine, the motor cyclist should be able to gain a very comprehensive insight into general motor and engineering construction. The book is published by Mecedry, Percy, and Co., Lower Abbey Street, Dublin,

and Iliffe and Sons Ltd., 20, Tudor Street, London, E.C., price 7s. 6d. The work is edited by that well-known motorist, Mr. R. J. Mecedry, and he is to be congratulated on the result of his labours.

The Junior and Otav Cars Co., Ltd., inform us that they have changed their telegraphic address from "Bertelli," London, to "Juniotav," London.

Referring to "Ixion's" remarks regarding the correspondent who complains that he is unable to fix a cyclometer to his spring forks, a correspondent informs us that he has a Quadrant with spring forks to which an ordinary Veeder cyclometer is attached with perfectly satisfactory results. At first he lost two of these instruments in quick success, owing to attaching them in too vertical a position, the movement of the front wheel in striking a bad rut in the road forcing the cyclometer against the forks and breaking it.

LETTERS TO THE

THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

A Problem to be Solved.

[3624.]—In reference to the subject "A Problem to be Solved" in recent issues, may I suggest that by raising the exhaust valve slightly, the amount of work previously expended by the engine in so doing is converted into extra r.p.m.

A. G. FENN.

Automatically Variable Pulleys.

[3625.]—With reference to letters 3619 and 3620 from Messrs. Parkinson and Lloyd Wright in the issue of October 21st, in which both gentlemen mention that they have for about twelve months been running a pulley made somewhat on the lines of Mr. Lloyd's automatically variable pulley, illustrated in your issue of October 14th, we would like to point out that Mr. Lloyd is fully aware of variable pulleys having been made in the past actuated by a spring, but it will be noticed, even from the line drawing in your issue of the 14th, that Mr. Lloyd's construction differs very materially in several points, and we would particularly emphasise the ball bearing device, which will come into operation when the pulley is used to give a free engine.

THE LLOYD MOTOR AND ENGINEERING CO.

Sparkign Plugs and Compression Ratio.

[3626.]—I have recently purchased a $3\frac{1}{2}$ h.p. Quadrant 1908 motor cycle, a.o.v. model, magneto ignition, which, owing, in my opinion, to high compression, makes short work of sparking plugs. In 500 miles I have used no less than six different sparking plugs (all magneto type):

1. Oleo—porcelain broke in pieces first day.
2. A good mica plug—inside blown clean out.
3. Warrior—metal base softened, causing the plug to be shot out of the cylinder.
4. Pogon—porcelain cracked.
5. Peto and Radford—porcelain broken.
6. Standard—has run about fifty miles, and is standing well.

Most of them went when climbing steep hills at speed.

Perhaps some of your readers will state their experiences with sparking plugs in high compression engines.

The bicycle itself is giving the greatest satisfaction in every way.

RAYMOND CRAWSHAY.

Fast Times in America.

[3627.]—Having been a subscriber to *The Motor Cycle* for the last two years, I wish to compliment you on the way you conduct your publication, and only wish we had a similar one here. You are not prejudiced in favour of or against any make of machine, and always give without hesitation accounts of any trouble riders may have with their machines in endurance runs, hill-climbs, and race meets. One very seldom sees anything in our magazines like that.

I have just returned from Indianapolis, Indiana, where a motor meet was held on a mile track, with 4ft. of banking on the turns, and a fairly hard surface. Fred Huyck, an Indian rider, on a 7 h.p. twin, rode ten miles in 9m. 38s., or an average of 57 $\frac{4}{5}$ s. to the mile. His fastest mile was 55 $\frac{2}{5}$ s. in this event.

Three weeks ago he rode ten miles in 9m. 17s. at Detroit, Mich., on an unbanked track, or 55 $\frac{2}{5}$ s. average for each mile. His best mile in this event was 53s.

I thought some of these times might be of interest to your readers.

Again wishing you success with your magazine,
Chicago.

G. W. LYON.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Carburettors.

[3628.]—"Ixion's" article on carburettors is very interesting indeed, and will do the motor cyclist good in the future.

Like "Ixion," I have never found a carburetter that admits of enough extra air, that is, to run an engine very slowly and very fast.

I have now a B. and B., and I find by having a hand slide to cover the holes where the air is supplied to the mixing chamber I can get over the trouble, and one is able to start without flooding. Also in traffic where one must slack down, the slide can be partly closed, and the engine with the throttle slightly open can be made to run exceedingly slowly and sweetly.

I am a believer in this method of governing the carburetter from the main air intake, as well as the extra air.

EXPERIENCED.

The Gianoli Magneto Transmission.

[3629.]—With reference to the letters which have appeared in recent issues respecting the Gianoli drive as applied to the magneto on the Moto-Rêve, "F.P." is in error in assuming that the pitch line of the Moto-Rêve gear wheels is circular, which, as he conclusively proves, is impractical and unsatisfactory; even if deeply-cut teeth were used, as he suggests, they would alternately play fast and loose. In the case of the Moto-Rêve, the depth of tooth required to allow for meshing would be so great as to prevent the teeth clearing, and would simply lock the wheels.

We are sending you a full set of wheels, and you will notice that the eccentric ones are ellipses.

THE MOTO-REVE CO., LTD.

[We have examined the two eccentrically-centred driving pinions of the Moto-Rêve magneto transmission, and find they are ellipses. The ellipticity or deviation from a true circle is so slight that it certainly does not exceed the amount mentioned by Mr. Sommerville and quoted in "Current Chat" (page 806), viz., nine one-thousandths of an inch.—Ed.]

Spring Frames on Sidecars.

[3630.]—Having read with a considerable amount of interest the various letters which have appeared from time to time in your most excellent paper on the subject of sidecars, I think perhaps it might be of interest to your readers to hear the experience of a private owner with what I believe is entirely a new idea in the sidecar world. I refer to the new spring frame sidecar which was illustrated in your paper a few weeks ago. Seeing that it was being made by the Oakleigh Motor Co., West Dulwich, and being rather attracted by the design, I called on them and had a full trial. I must say that the result astonished me. It is truly a revolution in sidecars. One cannot feel the road shocks at all, and this in Dulwich, where there are about the worst roads about London, means something. By the courtesy of Mr. Durant, the manager, I was allowed to drive one as well as to ride in one. It certainly seems to steady the machine more than any other sidecar I have previously tried. My advice to everyone who is interested in sidecars is to try one.

I need scarcely say I have no interest in the firm in question.

LB 808.

Is the Tricar Dead?

[3631.]—Apparently so by the few to be seen on the roads, and yet there is a little tricar made by the Rex Co. which ought to become popular. I am referring to the Litette. I have been the proud possessor of one of these

light, strong, powerful, and speedy machines for about fourteen months, and have made many pleasant and long tours with it. My latest and most pleasant trip took place early in October. I and a fellow passenger with a somewhat weighty portmanteau left Clacton-on-Sea one bright glorious morning for a trip to the Midlands and West of England, our first day's destination being Leamington Spa *via* Cambridge, Wellingborough, and Northampton. Leaving Clacton-on-Sea at 8.30 a.m. we reached Leamington at 5 p.m. I will not now trouble to give the route followed for the six days, as this would serve no useful purpose, but I would like to say that during the six days' running the only mishap we had was the breaking of an inlet valve cotter pin, which as I had no spare cost me 1½d. to replace. We did not even experience a puncture, which is no doubt in a measure due to the Litette being shod with Continental "Modèle de Course" tyres, which are wearing splendidly. The drive is by a Whittle link grip belt. Before starting on tour I purchased one of Warner's belt cleaners, as described in *The Motor Cycle* of September 16th. I found this a very useful little tool, and just the thing for cleaning a leather belt. The Litette is a real good hill-climber, as very seldom, with all the weight we carried, had we to resort to the first speed. I have never dismantled the engine, and the same sparking plugs as supplied with the machine are still in use. I have no interest in the Rex firm, and only desire to say that anyone wanting a light, strong, comfortably sprung tricar might by purchasing a Litette secure much fun and pleasure at a very low cost for upkeep and running expenses.

H. R. C.

[3632.]—I send you herewith a photograph of the rear of my tricar, which may interest your readers.

A rear sprung tricar described in the accompanying letter.

The frame is sprung on coil springs, which work on steel guides, doing away with the tendency to roll. The seats are side by side in the centre of the machine where the least vibrations are felt. The back air tube can be removed without taking the wheel from the frame. Engine, 84 × 84. The speed averages above the legal limit, and it has been running fourteen months. During that time it has covered 4,000 miles. The replacements have been two exhaust valves, one trembler blade, and back cover retreaded. It does sixty miles to a gallon of petrol, and I

have yet to experience a broken chain. MONT. SMITH.

Lightweight Singles and Motor-assisted Tandems.

[3633.]—I have noted the remarks in your valuable paper *re* the above, and as one who formerly used a 3½ h.p., I should like to say that I have given up for ever the idea of ever riding one again, as I find that one can get all that is required out of a lightweight of 1½ h.p.

I am 12 st. 7 lbs., and have been carried across Dartmoor from Exeter *via* Moreton Hampstead to Plymouth, taking all hills with perfect ease. Further, I have ridden from Taunton *via* Bath to London on the aforesaid 1½ h.p. in nine hours!

It may interest your readers to know that at the present moment I have a 1½ h.p. motor attached to a heavy tandem, and that I carry a lady thereon, together with 35 lbs. of baggage, and have found no trouble, provided both passengers give a little pedal assistance on the steep hills.

As I am anxious not to unduly advertise any machine, I will content myself by saying that the upkeep of such a machine as regards tyres and petrol is purely nominal. One pair of good extra heavy 1½ in. roadster tyres will do from 4,000 to 5,000 miles, and a gallon of petrol will carry a rider

of my weight at least 140 miles, and two riders about 115 miles. I am of the opinion that there is no need for heavier tyres than the above on 1½ h.p. motor bicycles.

Evidence is not wanting that we are getting back to light-weights permanently, both as regards motor bicycles and motor cars. Let me here suggest to any of your readers the idea of giving a trial to light motors such as I have mentioned on tandem bicycles. It will be found safer than sidecars, and infinitely more exhilarating and pleasant for both, as the slight pedalling as occasion may from time to time demand in hilly country affords a pleasant and healthy relaxation for both riders.

I have no hesitation in recommending those who need an enjoyable time on their tandems to try the 1½ h.p. motor attachment which I now use. The motor-assisted tandem is the cheapest and most delightful pastime that can be imagined, and should come as a boon to our numerous friends who have light banking accounts.

J. W. CHALFONT.

[3634.]—You have published several letters lately on "The Lightweight," and perhaps you would not mind me adding a little to what has been already said.

A few months ago I found myself without a motor cycle and had to decide on what to get. I wanted a machine that was easy to handle in traffic, as my principal riding would entail about fifteen miles of it before getting clear of London. Next, I wanted a machine that was economical in upkeep and comfortable to ride. My choice fell on a 2 h.p. Moto-Rêve, and having done 1,200 miles on it, I am as pleased with it as I was on my first ride. For comfort and reliability it has been without an equal, and purrs up and down hill at an average of twenty miles per hour for any length of time. My only troubles have been belts, owing, I think, to the small engine pulley. Tyres wear well, but are not big enough to prevent stones denting the rims.

I suppose I must say I have no interest in the firm except as a satisfied user of what I consider to be the best lightweight on the market, and wish the makers all the success that is due to them. Also I must say a word for the most courteous way in which I have been treated in all transactions with the makers.

G. L. ANDREWS.

Passenger Work, by Two-speed Gear and Otherwise.

[3635.]—I have been much interested in reading the varied correspondence on this subject in its various aspects.

To begin with, the belt undoubtedly has its limitations for passenger work in hilly country. My experience, extending over twelve years, is that leather belts are apt to slip when called upon to do double duty, and that rubber ones very soon pull out, especially when put to the extra strain of changing from low to high gear.

I have often wondered that no mention has ever been made of that excellent compromise, the Simkins chain band. I adopted it some time back on my 3½ h.p. Minerva, after trying one or two two-speed gears, which failed miserably to come up to expectations, and the consistent reliability and freedom from worry which this simple contrivance gave me I shall never forget. By its means I was able to reduce my gear (permanently, of course) to 7½ to 1, and thereby to surmount, with passenger, all the severe gradients on our main roads about here. The low gear made starting very easy, and, with careful driving, overheating did not occur. It is, of course, quite easy to have more than one engine sprocket, and to change over, as in the case of pulleys. To anyone not wishing to incur the expense of a two-speed gear I can confidently recommend this device.

There is no doubt, however, that a change speed gear is the ideal thing, and I hesitated a long time in view of my previous experience, before giving up the trusty Simkins band for another experiment. I have, however, quite recently, sent my machine (the same 3½ h.p. Minerva) to Messrs. Wall for their Roc conversion. I have as yet had little opportunity of giving it a long trial, but the work it has done so far has been of a very trying description. I must say I am most favourably impressed, first, by the very substantial and businesslike way in which the conversion has been made and the excellent finish put on it, and secondly by the really delightful way in which the gear and clutch operate. Everything has been well thought out, and is most convenient, and, as a driver of many cars, I must congratulate the firm upon having produced something very much more pleasant to manipulate than the average small car con-

trol. It is indeed a "conversion," and I am prepared to accept any reasonable offer for my pedal gear, now resting in a corner of the motor shed.

A correspondent of a few weeks ago asked about the reliability of the Hellesen dry cells. I have had a set in use since last Christmas, and I may almost say that until his query appeared I had really forgotten all about them, for they never cause a moment's worry. I remember putting a volt and ampèremeter over them last Easter, and found the current at its original strength. I have not thought of them since. I used to carry a smaller set as spares, but one day I dropped them on the road, and apparently smashed them up. However, they have been doing electric bell work indoors for the last six months with complete satisfaction.

Devon.

(Dr.) CLAUDE A. P. TRUMAN.

The Knight Slide Valve Engine.

[3636.]—In a paragraph in "Occasional Comments" in your issue of the 21st inst., your contributor states that he has been unable to hear that Mr. Knight has granted a license for his engine to any motor cycle manufacturer in any country. We should have thought that, before penning this, your contributor might have ascertained whether our license includes such rights, for he must be aware that our company constructs motor cycles as well as motor cars. We may inform you that the license granted by Mr. Knight to the Daimler Motor Co. as well as to ourselves provides for all internal combustion engines.

We are considering whether we will eventually fit the slide valve engine to our motor cycles, and if we decide to do so, it will be the best proof that we have found that the advantages claimed for the new engine also apply to the motor bicycle without any drawbacks.

MINERVA MOTORS, LTD.

Hill Climbing.

[3637.]—In reply to Mr. Karslake's doubting letter, may I quote the following extract from Mr. H. C. Lafone's article entitled "Haigh Exmoor" in *The Autocar* of September 26th?

Mr. Lafone is an experienced motorist, as well as an excellent writer on motoring topics, and his words therefore carry weight. "Mr. Totterdell, who drove me, made promise of providing me with sensations, and he kept his word, for he proceeded to take me down to the Barnstaple-Lynton Road by a gentle slope entitled 'Beggar's Roost,' with a reputed gradient of 1 in 3! I am rather sceptical of local information concerning the steepness of hills, but I can only say that if this Beggar's Roost was not 1 in 3, I never want to encounter a hill that is. The name of the hill is odd, for I do not think I ever came across a beggar who would have mustered up the energy to get even half-way up such a hill to 'roost' on it. Words fail in attempting to describe this gradient. Those who were on the 2,000 Miles Trials will get some idea of it when I say that Amulree was child's play compared with it."

In Lynmouth we were assured that the hill was called Beggar's Roost, sometimes Riddaway Hill, and occasionally Barbroke Mile Hill.

IVAN B. HART-DAVIES.

A Warning.

[3638.]—I must protest against the misrepresentation practised by a certain class of second-hand advertisers in *The Motor Cycle*. The latest example to come to my notice is in connection with a 3½ h.p. Vindec Special which is offered for sale. It happens that I have seen this particular machine, and can vouch for the accuracy of this statement. The advertisement stated it to be a late 1907; yet the makers will tell you that this machine was sent out in May, 1907. I submit that too free a use is made of the word "late" by these advertisers, as it leads buyers to believe that a machine has had considerably less wear than is actually the case. In this particular instance a person would conclude that the engine has had only one season's wear, whereas the facts show that it has been through two seasons. This is particularly reprehensible, in that the buyers most likely to be misled, and possibly disappointed, are novices, who are, of course, unprepared for such practices.

I know full well that your good selves would be the first to condemn, in the strongest possible terms, any attempt at deception in advertising, yet at the same time it is practically impossible to guard against it. I hope, however, that some good may be done by publishing this letter, in the hope that it

may catch the eyes of prospective purchasers, and warn them to fully satisfy themselves as to the age of a second-hand motor cycle before paying over what may be to them a large sum of money. Experienced motorists know, but, as a rule, beginners do not, that a motor car or cycle depreciates somewhat quickly in market value, and that a season or so makes a considerable difference in the price.

G. C. SWEET.

[We recommend readers to adopt the deposit system in all cases when dealing with unknown advertisers. Full particulars of this system are published in each issue.—ED.]

The A.C.U. 5s. Membership Scheme.

[3639.]—If you would open your correspondence columns for the discussion of the above scheme I think you would be doing hundreds of motor cyclists who live in the country a real service.

Who wants a 5s. membership scheme? What we do want are real live local social motor cycle clubs established where motor cyclists are numerous, and if the A.C.U. would spend some of its time, organisation, and money in assisting into being such clubs it would eventually repay it tenfold more than the 5s. scheme.

Clubs with a good social element in them will prove a success, and the establishment of such will make the A.C.U. and motor cycling a power. That something of the kind is needed is shown by the fact that between Highgate and Barnet (as far as I am aware) no motor cycle club exists, although there are hundreds of motor cyclists who live close to one of the finest roads out of London.

If one of the benefits to be given to us country motor cyclists is the *Journal*, then it is one which we can very well do without. A good chatty journal run in connection with these proposed clubs would be a real pleasure to the members. I cannot see any real benefits can be offered for this paltry sum.

My wife and I touring as members of the C.T.C. some years ago had the following amusing experience. At one hotel the bill was brought, and mentioning to the maid we were members of the C.T.C. the account was taken back for correction. When it was returned the amount was more than the original plus the discount.

I do not think we want a discount scheme in connection with hotel charges, but we really do want an hotel scheme. Charges have gone up fifty per cent. in most places during the last two years. In many hotels in addition charges are made for storing at the rate of 1s. and 1s. 6d. for motor bicycles; in fact, if a car were being used instead of a cycle the charges would be about the same. Our touring wants are good accommodation and at a reasonable rate. This question is a very urgent one, for very often when arriving in the evening, perhaps dusty and tired, you are shown to some miserable room. Why can we not have an hotel list in *The Motor Cycle*, where we could see the names of the hotels to make for when on tour, and where at the same time we should be welcomed?

The A.C.U. did give us an afternoon's real pleasure on October 3rd by having the penalty run, some of the factors contributing to make it so being the small entrance fee, and the early start, the latter enabling those of us who had ridden a distance to get home the same night.

Why can we not have more of them, or something similar? and at the same time a change of route, and thus stir up the dormant motor cyclists in these districts where no club exists?

If the A.C.U. or Motor Union will do some of these things for us it will get our enthusiastic support.

C. C. COOKE.

EXPERIENCES WANTED.

"F.B.," New Brighton, would like readers' experiences with a Mabon clutch on a 7-9 h.p. twin Peugeot with side-car, weight of passenger and driver twenty-four stones. Also brand of oil most suitable for the above engine.

"Maori" (New Zealand) would like readers' experiences of the 1½ h.p. lightweight F.N., particularly as to the method of manipulation to obtain the slowest possible speed, ease in starting, care of transmission gear, and efficiency of brakes. Also general suggestions likely to benefit an inexperienced rider of 11 stones in a very hilly country with bad roads, necessitating care and slow speed.

RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

A Butted Air Tube.

The illustration represents diagrammatically an air tube enclosed within its cover. The ends A and B of the tube have secured to them circular tapered ends C D, the walls of which are of gradually increasing thickness. The object of this increasing thickness is that the ends may better withstand the air pressure set up by the rotation of the wheel on the ground.—T. H. R. Craig, No. 20,797, 1907.

Big Ends for Two-cylinder Engines.

This invention has particular reference to the type of two-cylinder engine in which two connecting rods are mounted on the same crank pin. The big end A of the connecting rod B is mounted directly upon the crank pin C, and its exterior surface is formed conical. Upon this conical portion is placed a ring D, which is coned internally to correspond with the exterior of the big end, and this ring is locked in position by a nut E and lock nut F. The exterior of the ring D is formed cylindrical, and provides a bearing for the second connecting rod G.—De Dion-Bouton (1907), Ltd., No. 1,443, 1908.

A Single Lever Carburetter Control.

The pure air inlet A and carburetted air outlet B are each provided with a shutter, both shutters being mounted upon the same spindle C. At its upper end this spindle is provided with a crank and connecting rod H, by which it is connected to the operating lever D, which is arranged in the central plane of the carburetter. The lever D carries a depending spindle E, which carries at its lower end a register device F, which co-operates with a partition G in the carburetter to permit, at certain times, pure air to pass through the carburetter without passing through the restricted area around the jet nozzle. The connecting rod H is extended as shown at J, and a spring L surrounding this extension is adapted to hold the operating lever D and connecting rod H normally in the position shown. In operation, when the lever D is rotated to open the inlet and outlet passages A and B the register device F is also rotated, but not sufficiently to open the air passages therethrough. When, however, the passages A and B are fully open their connecting rod H comes in contact with a stop K, which prevents further

B the register device F is also rotated, but not sufficiently to open the air passages therethrough. When, however, the passages A and B are fully open their connecting rod H comes in contact with a stop K, which prevents further

movement thereof. But the operating lever may travel still further, compressing the spring L, and further rotating the register device F. This opens the air passages therethrough, and air is allowed to pass through the carburetter without passing through the restricted space around the jet. A small opening shown in the shutter B permits a small amount of gas to pass when the engine is running "light."—Soc. F. et G. Longuemare Frères, No. 9,202, 1908.

A Locking Device for Stands.

The quadrant A is formed integral with clip B, which is bolted to the chain stay C. The leg D is pivoted at E, and is provided with a catch F adapted to engage holes G and H in the quadrant and hold the leg in the

desired position. The catch is impelled to shoot into the holes G and H under the influence of a spring G, and is formed with an extension K, by which it can be easily depressed when it is desired to withdraw the catch and move the stand.—T. Price, No. 7,520, 1908.

A Belgian Carburetter.

This carburetter consists of a casing A, in which is arranged a conical induction chamber B. The lower end of this chamber surrounds the jet nozzle C, and its walls at this point are extended radially and lie on a perforated disc D, through which the air to be carburetted must pass. The disc D is provided with a central orifice through which the jet nozzle C projects, and also with a number of annular orifices around the central orifice, these annular orifices being closed at low speeds by the radial extension of the walls of the induction chamber B. A spindle projects upwardly from the chamber B, and carries at its upper end a piston E, between which and the carburetter wall is arranged a light spring F. The spindle is made hollow in order to put the space between the piston and the carburetter body into communication with the induction chamber B. At low speeds all the air entering the carburetter passes through the central orifice of the disc D, but on the suction increasing, the induction chamber B is lifted, due to the pressure of air on its under surface and the vacuum created in the space between the piston E and carburetter wall, thus allowing additional air to enter through the annular orifices in the disc D.—J. Fagard, No. 9,170, 1908.

THREE SPECIAL SHOW ISSUES of "The Motor Cycle" will be published on the following dates November 18th and 25th, and December 2nd.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

The Motor Cyclist's great need is a perfect system of luggage carrying equipment. This is best provided for in the latest pattern Motor-cycle Bag set—the

BROOKS

complement of every modern Motor Cycle.

The set consists of Carrier, Pannier, and Frame Bags as shown by accompanying illustration.

Provision is made for Clothing, Spares, Tools, Maps, etc., and ingenious receptacles are included for various purposes.

The whole are made of finest quality water-proof canvas on special fibre board, have strong locks, and are fastened securely to prevent rattling.

These bags are rain and damp-proof and afford the safest protection for all luggage. Ask for our Motor Cyclists' List.

J. B. BROOKS & Co., Ltd.,
Dept. 45, Gt. Charles St., Birmingham.

BROOKS Motor Cycle Baggage Equipment.

THE MOTOSACOCHE

possesses advantages over all other motor cycles which cannot be disputed or under-estimated. It is very light. All its motor mechanism can be removed from the cycle in the space of a few minutes. It is clean. It is reliable. It is silent. It will travel from 5 to 30 miles per hour. It will ascend gradients of 1 in 10 without pedal assistance. AND, it is economical both in first cost and upkeep.

The MOTOSACOCHE is £30 only.

Write for full particulars:

H. & A. DUFAUX (England), LTD.,
65, Holborn Viaduct, LONDON, E.C.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London (20, Tudor Street, E.C.), by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

THE CLAIM

of the PREMIER CO. to be the LARGEST FIRM in the WORLD dealing in NEW and SECOND HAND CYCLES is based on FACT. There are OTHER CLAIMANTS to this distinction—BUT their claims have OTHER FOUNDATIONS.

SECOND-HAND & SHOP-SOILED BARGAINS.

THE NEW PREMIER HORNS.

BINOTE.
TRINOTE.
BETTER THAN THE ORDINARY HORN,
because their sound carries twice as far and is less offensive—more musical.

For town riding, they are audible above the rumble of dense traffic.

They will be the most popular road-clearers for 1909.

ON THREE DAYS' APPROVAL.

7/6. 10/-.

PREMIER TUBULAR CARRIERS.—Fit all makes. 7/6 each. Approval.

PREMIER GENERATORS.—As supplied with the famous Searchlight. 6/- each. Approval.

CLINCHER BRAND NEW TUBES.—26×2¼in. 6/6 each. Approval.

PREMIER ACCUMULATORS.—The cheapest and most durable.

WRITE FOR LISTS.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.

Telephone 4,310. Telegrams: "Primus, B'ham."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Illife and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

117 & 118, CHEAPSIDE, } London, E.C.
1, 2 & 3, MILK ST. BLDGS., }

Have YOU tried the new Road-clearer for bicycles?

TAMBOURONG

Replaces the old-fashioned bell and horn.
The Effect is Startling!

Fixes on front forks. A cord from handle-bar pulls trigger when required in contact with front wheel spokes and sounds like a noisy drum or gong.

Stamped metal gong, 1/6.

LEO. RIPAULT & CO.,

64a, POLAND ST., LONDON, W.

Sole Agents for the genuine Parisian made article.

NOTICE. As we find the parchment model is detrimentally affected by damp weather we have abandoned this pattern in favour of the new stamped metal gong, which is the thing for Motor Cycles, and made specially strong.

GODFREY and Applebee.—Great bargains in tyres and belts; liberal allowances on old covers.—165a, Hoe Street, Walthamstow. Phone, 464, Walthamstow.

LOOP Frame and Tank, handle-bars, saddle, chain wheel and cranks, belt, pair new wheels, free-wheel; £2 15s.—B., 71, Winkfield Road, Wood Green, N.

73Ft. 1in. Intermediate Watawata, 16s.; 74 7½ft. 3in. Fishback, 6s., both nearly new; Rex carrier, 5s.; Bucket seat, suit Rex de Luxe, 8s.—65, Douglas Road, Handsworth, Staffs.

READERS having Photographic Apparatus for sale should advertise in "Photography and Focus" Emporium; 1d. per word, minimum 9d.—Address, "Photography and Focus" Offices, 20, Tudor Street, London, E.C.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS.

ALVASTON Bargains.—7 h.p. Crossley oil engine, complete with all fittings, nearly new; accept £32, worth double; seen running any time; guaranteed absolutely perfect throughout.

ALVASTON Bargains.—Brand new Gianoli magneto, four-cylinder, high tension, superb instrument; listed £14, accept £6 10s.; fully guaranteed.

ALVASTON Bargains.—Water-cooled Aster 6½ h.p. head; accept 25s.; new, perfect.

ALVASTON Bargains.—Latest pattern M.O.V. Rover 8 h.p. cylinder, guaranteed perfect as new; 30s., worth £4.

ALVASTON Bargains.—Genuine 3½ h.p. water-cooled De Dion motor, complete with coil, carburetter, silencer, guaranteed perfect throughout; £6 10s.

ALVASTON Bargains.—De Dion two-speed gear, complete, unexcelled for tri-car work; 70s., perfect.—Alvaston Motors, Derby.

MABON Clutch, brand new, 30s.; enclosed fan, 12s. 6d.; Minerva-Longuemare carburetter, 15s.; trembler coil, 5s.; accumulator, 3s. 6d.—57, Park Road, West Dulwich.

MOTOR Cycle, long, low, Perry's extended frame, girded head, and fork, new tank, plated rims, Dunlop tyres, complete, less engine; £3 15s.—11, Brunswick Square, Gloucester.

WICKER Bodies, splendid finish, strong, 15s.; Pumfrey clutch, unused, drives fan also, suit passenger machine, cost £5, 30s. to clear.—Nevett, 10, Barnsbury Road, London.

BARGAIN, £3 10s. cash.—Quadrant loop frame, complete, forks, wheels, handle-bars, brakes, tanks, tyres, coil, and new belt rim oil pump.—Timms, Guildford Road, Frimley Green.

TWO ¾ in. Belts, 7ft. 2in., voltmeter and case, six plugs, 26 by 2 Continental tube (new), belt punch, test lamp; £1 the lot. — Motor, J. E. Dainton, 51, Redlaver Street, Grangetown, Cardiff.

N.S.U. Two-speed Gear, 4½ by 1in. pulley, fits 5 h.p. Peugeot or Vindec, £3; Osborne 1907 four-speed gear, fits 4 h.p. Stevens, £2; 3 h.p. Triumph, piston, and rings, 7s. 6d.—105, Lark Lane, Liverpool.

MATEUR Photographers.—Superior enlargements (bromide), from your negatives, 8 by 6, 9d.; 10 by 8, 10d.; 12 by 10, 11d.; 15 by 12, 1s. 1d.; cash; from prints 6d. extra.—Greame, Wellesley, Whyteleafe.

TORPEDO Tanks in brass, copper, and tinned steel, from 5s., best finish; swan-neck saddle-pillars, all sizes, 2s. 6d.; long handle-bars, all sizes, 4s.—Arrow Motor Works, Victoria Road, Peckham, S.E.

PUNCTURES.—While you are overhauling your motor cycle this winter fit our leather bands; they strengthen the tyre, and stop you from puncturing; 2s. each.—Barton, Meeting House Lane, Peckham.

LIGHTWEIGHT Clement-Garrard engine, 30s.; tank for petrol, oil accumulator, 15s.; Clement-Garrard two-speed gear, 25s.; engine chains, ¾ in. pitch, 70 and 20in., 6s. 6d.; sprocket, 52 teeth, 4s.; all in good going order.—Hope, Battlehill, Hexham.

PULLEYS for any motor.—De Dion, M.M.C., 6s. 6d.; Antoine, N.S.U., Kelecom, Roc, F.N., 5s. 9d.; Peugeot, Brown, 5s. 6d.; Triumph, Fafnir, Sarolea, Minerva, 4s. 9d.; plated, guaranteed, carriage paid.—J. Perkins, High Road, Leyton, London.

WINTER Riders use K. brand motor cycle oil for easy starting, gallon tins 4s., half gallon 2s. 3d., quarts 1s. 4d.; on approval, carriage paid; K. special, for high compression engines, 5s. 6d., 3s., 1s. 9d.—Kelly and Co., Bridge End, Leeds.

LONGUEMARE H. Carburetter, 12s. 6d.; White's economiser, new, 3s. 6d.; XI'all forks, 10s.; spare spring, 6d.; tank levers, complete, fit Brown, 2s.; carrier-stand, 1s. 6d.; Duco bag, 1s.; handle-bar control and cable, double, 7s.—Engineer, 4, Northfield Avenue, Ayr.

HALIFAX.—Gillett and Lehmann controller, 15s.; N.S.U. two-speed gear, £2 15s.; new Premier accumulator, 7s. 6d.; new car accumulators, 12s. 6d.; special double-twist horns, 5s. 3d.; separate generator head-lights, 6s. 9d.—Halifax Motor Exchange, Westgate, Halifax.

SMOOTH-TREAD TYRES!
WARNING!!

We would particularly draw readers' attention to the Editor's warning in "The Motor Cycle" of the 21/10/08:

"SMOOTH-TREAD or worn tyres are almost CERTAIN to cause side-slip on motor cycles. STUDDED TYRES are a CERTAIN PREVENTIVE of side-slip. . . . We recommend ALL riders in the Autumn and Winter to have these tyres fitted to their machines."

We are special Agents for ALL rubber and steel-studded covers.

NOTE.—Your own cover can be converted into a studded non-skid by having a rubber or steel-studded band fitted.

BANDS, RE-TREADING, and Repairs OUR Speciality. (All makes of bands fitted)

Shamrock, Clincher, or Goodrich Rubber Studded Non-skid Bands, £1 1s.

Whatever your requirements, write for our new "ILLUSTRATED TYRE LIST" (sent free). This gives prices of all covers, full particulars of our allowances on old covers, prices for re-treading, fitting bands, etc.

Special Trade List on application.

THE "ROM" INNE TUBE.

"TH CAR TUBE IN MINIATURE."

Prices, complete with valves.

26 & 28 x 2, 9/- Endless, 11/- Butt-ended.

26 & 28 x 2½, 10/- " 12/- " "

26 & 28 x 3, 11/- " 13/- " "

Extra heavy quality only

The CONTINENTAL MOTOR CO.,

32, Rosebery Avenue, LONDON, E.C.

'Phone: Holborn, 1513. Tel.: "Bromitch" London.

PLEASE NOTE THAT ALL "ELECTARY" Accessories (as described in the last three issues of "The Motor Cycle," and including the famous Lens-mirror Projector, the Electric Head and Side Lamps, the Combined Tyre and Belt Case, White's Patent Economiser, and numerous other novelties) will be exhibited at the **STANLEY SHOW (Nov 20th)**, on **STAND NO. 193 GALLERY, N.B.**—Particulars of the "ELECTARY" Accessories forwarded on receipt of enquiry.

W & R Jacobs, 39c King William St. London Bridge, E.C.

Phone, 7930 Wall.

Tele. "Electary" London.

Is mechanically correct.
Is absolutely rigid laterally.
Allows free movement vertically.
Takes a front rim brake.
Will last as long as the machine,
and make the machine last longer.

A. DREW, Conybere St., BIRMINGHAM.

MISCELLANEOUS.

TWO Parsons Non-skids, perfect, 5s. each new 4in. lens mirror searchlight, exceptionally powerful, newspaper readable 200 feet, 9s. 6d.; new coil, 7s. 6d.; approved gladly.—Sydney, 34, Bedford Square, London.

THREE-SPEED Free Engine Pulleys.—New three-speed free engine pulleys, equal new, cheap; two-speed free engine pulleys, £1; approval, deposit.—New Nonpareil Motor Fittings, Ashtree Road, Stirchley, Birmingham.

NO. 6 Pattern Frames, with girders, tanks, wheels, etc., to suit; long handle-bars, 4s.; swan-neck saddle-pillars, 2s. 6d.; all to your own requirements; quick deliveries.—Green, 14, Avondale Road, Peckham, S.E.

BELTS (V), new, ¾ in. Dermatine, 7s.; ¾ in. Gloria, 7s. 6d.; ¾ in. hide, 6s.; Lycett 1in. hide, 10s.; ¾ in. canvas, 6s.; new separate generator lamp, 10s. 6d.; red lamp, 3s.; long bars, 3s. 6d.; Longuemare and tube, 15s. leather breeches, 10s. 6d.; etc.—161, Essex Road, Islington.

WHY buy another Lamp? Let me show you your rim with a plano-convex projector lens; 3in., 3½in., 3¾in., 1s. 9d.; 3¾in., 2s.; 4in., 2s. 6d.; 4½in., 2s. 9d.; 4¾in., 3s.; 4¾in., 3s. 6d.; 5in., 4s.; satisfaction guaranteed or your money returned.—Payne, Metchell Lane, Harborne.

WHAT Offers, 4 h.p. Jap engine, complete with induction pipe and Jap carburetter, plain coil, exhaust pipe and silencer nearly new, also Fit-all two-speed gear, run 50 miles, pair Minerva spring for Kerry-Abingdon free engine clutch.—F. Cox, Perry Road, Bristol.

8ft. 6in. ¾ in. Camel Belt, nearly new, 6s. 8ft. 6in. ¾ in. Lycett belt, 4s.; 3½ h.p. Minerva piston, complete, 6s.; 25 amp. accumulator, 5s.; pair 18in. handle-bars, plated, 5s.; 28 by 2 inner tube, 2s. 6d.; ¾ in. pulley, new, 3s. 6d.; surface carburetter, 2s.—H., Folkestone Road, Upper Edmonton.

CASH Bargains.—Prested 12 amp. accumulators, 9s. 6d.; two-way switches, 2s. J.B.D. silencer, 4s. 6d.; searchlight lamp with separate generator, 22s.; volt or am meters, 4s. 6d.; large double-twist horn, 5s. 6d.; belt fasteners, 8d.; belt punch, 1s. 3d.; ratchet plated control levers, 1s. 6d. double with clip, 5s. 6d.; motor cycle two speed hubs, 50s.—Bastone, see below.

CLINCHER A Won Motor Cycle, B.E., 28 2½, 21s.; Clincher heavy car covers, by 85, T4, 45s.; T3, 43s.; 700 by 65, T1, 26s. Bastone, see below.

MOTOR Cycle Covers, wired edge, 26 by 2½, and 2½, 11s. 6d.; 23 by 2, 2½, 1 6d.; headed edge, 2s. extra; Clincher motor cycle tube, 26 by 2½, 6s. 9d.; Macintosh tub 26 by 2½, 23 by 2, 6s. 9d.—Bastone, see below.

BELTING, best quality leather, V, ¾, ¾, 8d., 10d., and 1s.; rubber and canvas, 1in., 1s. 2d. per foot; approval again cash.—Bastone, 215 and 217, Pentonville Road, King's Cross, London, N. Telephone 2481 North.

5,000 Government Gauntlet Gloves, 6d. pair; 500 leather belts, and 1s. 3d. each; leather leggings, 2s. 6d. a pair; Bedford cord riding breeches, 4s. 6d. and 5s. 6d.; Government all-wool military socks, 10d. pair; police capes, 6d. and 5s. 6d. each.—Anscomb, Government Contractor, 14, London Road, London, S.

TRADE Direct and Save a Profit.—T Albany waterproof jackets, from double texture paramatta, at 18s. 6d., are going well, but for winter riding you may prefer our 21s. jacket, made from best plaid fawn proof, lined self beaverteen; this a heavy, warm, tailor made jacket, with latest improvements; any size sent carriage paid; cash with order.—G. Raws and Son, Indianrubber Manufacturers, Oldhall Street, Liverpool.

BARGAINS.—Back wheels, axles, spare gear, etc., for small car, 15s.; front wheels and axle, 5s.; steering wheel, complete, 2s. 6d.; ball bearing fan, 3s. 6d.; pair 815 by 105 Dunlops, nice condition, £2 Brooks B100 saddle, as new, 10s.; 3 h.p. sprayer carburetter, 4s.; 2½ h.p. motor cycle, leather carburetter, Minerva, nice condition, £2 large motor gas lamp, 5s.; quad frame differential gear, wheels, and tyres, £1; approval.—Motorist, 80, Bispham Road, Southport.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

ADDRESS—20, TUDOR STREET, LONDON, E.C.

The Knight Engine for Motor Cycles.

WE imagine that very few motor cyclists will not have heard of the new type of engine for motor cars which has been adopted by the Daimler Motor Co., Ltd., Coventry. Some readers will doubtless have had opportunities for reading in *The Autocar* and other papers a description of this new engine, but undoubtedly the great majority of motor cyclists are unacquainted with the method upon which it operates. Needless to say, we have had numerous enquiries from motor cyclists as to the possibilities of this slide valve system on air-cooled motor cycle engines, and last week in our "Letters to the Editor" columns we published a letter from Minerva Motors, Ltd., which was a reply to our contributor, "Ixion," who in the previous week's issue had mentioned the Knight engine and discussed its possibilities for motor cycle use. The letter from Minerva Motors, Ltd., merely states that they are considering whether they will eventually fit the Silent Knight slide valve engine to their motor cycles. Readers should first of all be informed that the license to manufacture the Knight engine in Great Britain has been acquired by the Daimler Motor Co., Ltd., who, unfortunately, do not make motor cycles, whereas the Belgian license has been granted to Minerva Motors, Ltd., who are large makers of motor cycles.

Now that the Minerva Co. have informed us that they are considering the adoption of this new type of engine on motor cycles, we have pleasure in placing before our readers an article describing and illustrating its mechanism.

The Knight engine has no poppet valves with springs controlled mechanically or automatically, such as are

fitted to all motor cycles, except those of the two stroke variety. Instead, it has two circular sliding valves fitting one over the other inside the cylinder, and inside the inner one of the two sliding valves the piston reciprocates. These sliding valves consist of two open-ended shells, which are reciprocated in a vertical direction by means of short connecting rods attached to a small crankshaft mounted above and running parallel with the main crankshaft of the engine. The small crankshaft in the case of the Daimler engine is driven by means of a chain and pair of chain wheels. Of course, this small shaft is driven at half the speed of the engine. The short connecting rods are attached to the open ended shells at their bases by means of lugs and bearings. It therefore follows that, when the small shaft is revolved at half the speed of the engine-shaft, the slide valves are reciprocated vertically, and each makes one upward and downward movement to two similar movements of the piston.

The Valve Ports.

Cut in the walls of these shells or sleeves are ports extending a considerable way round, which are covered or uncovered by the sliding of the shells over one another and in the cylinder. The exhaust ports are on one side, the inlets on the other. At certain periods, in accordance with the position of the piston, the ports in the sleeves and in the cylinder casting register with one another, thereby allowing fresh mixture to enter the cylinder, or exhaust gases to escape, as the case may be. The engine is worked on the four stroke principle, and in this respect does not differ from the ordinary engine.

The Knight Engine for Motor Cycles.—

On reference to the line drawing (fig. 1), which is a cross section of the engine, it will be seen that surrounding the piston U are the two open shells, B the inner one and A the outer one. K is a detachable combustion head provided with a number of piston rings which form the gas tight joint between the com-

bustion chamber and the shell B, the latter, of course, sliding vertically over the rings during its upward and downward passage to cover and uncover the ports. The ports in the shells are shown at H, J and Q being the ports in the cylinder casting, to the flanges of which the inlet and exhaust pipes are bolted. E is the small crankshaft previously referred to carrying connecting

rods C and D, which operate shells A and B respectively.

Reference to the diagrams on the next page will show the different positions assumed by the shells at different positions of the piston. The solid black portions on the slides represent the port openings, and when these two black portions are together they indicate the maximum openings of the inlet or exhaust ports.

The engine is lubricated in exactly the same way as a motor cycle engine, viz., by splash lubrication. Forced lubrication has been tried by the Daimler Co. and not found necessary. Motor cyclists, however, should take into account that the Daimler engine and also the latest patterns of the Knight engine as made in America are water-cooled. Nevertheless, we believe we are correct in stating that the Knight engine has been satisfactorily run air-cooled, and it will interest readers to know also that the first patent for the Knight engine shows a drawing of an air-cooled engine with radiating ribs exactly like a motor bicycle engine. The drawing of this patent specification was published in *The Autocar* of last week.

The four-cylinder Knight constructed by the Daimler Motor Co., Coventry, with a bore and stroke of 124 mm. by 130 mm., has given as much as 71 h.p. without racing the engine excessively, and without abnormally high compression. The R.A.C. formula for an engine of these dimensions, taking bore only into account, is 38 h.p.

Naturally, the Knight engine has been considerably criticised by various well-known motor engineers, but all seem to be fairly unanimous in their opinion that it is an improvement in some details over the ordinary type. At 119, Piccadilly, W., on October 15th, Mr. Chas. Y. Knight read an excellent paper to the members of the R.A.C., setting forth the advantages of his patent engine. The most interesting feature of this lecture, in our opinion, was the way in which Mr. Knight showed that the criticisms which had been levelled at his engine could mostly be satisfactorily answered, because they had had engines running at the Daimler Works for some months, which showed no signs of trouble in any shape or form, and gave more power than engines of the same make and dimensions which were made on ordinary lines.

Flexibility, Lubrication, and Compression.

A few brief extracts from Mr. Knight's paper, touching more particularly on the questions of flexibility, lubrication, and compression, which are the chief points of interest to motor cyclists in connection with the engine, will therefore not be without interest.

Among the claims made by Mr. Knight is the one of greater flexibility. This is a most important point in connection with motor bicycles, even more so than in the case of cars, because a motor cycle (or at least the majority) has but a fixed gear, whereas a car has three, and frequently four, changes of speed. The nearer a petrol engine approaches the flexibility of a steam engine, the easier it will be for motor cyclists to dispense with the complication of a change-speed gear, and if the Minerva Co. succeed in producing a more flexible engine on the Knight principle than has previously been possible with poppet valves, it will be a big move forward for the motor cycle.

A query on the subject of lubrication, particularly in cold weather, when the oil used is likely to gum,

The Knight Engine for Motor Cycles.—

up the slide valves and the piston brought the reply from Mr. Knight that the same results would occur with other motors. His reply, of course, referred to a water-cooled engine using oil that is considerably thinner than air-cooled oil. This sticking or gumming appears to us to be the most likely thing to spoil its

chances as a perfect motor cycle engine, because we all know that with only one piston a motor bicycle engine is somewhat difficult to free after standing for any length of time, even in warm weather, if thick oil is used, and copious injections of paraffin or petrol are required to ease the piston. Petrol or paraffin would doubtless do the same for the sleeves

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 1.—Commencement of the suction stroke. The outer sleeve is travelling downwards and the inner one upwards, making a rapid opening of inlet

Fig. 2.—Maximum opening of the intake. The crank pin has described an arc of 105°. The port opening at this point is 12 x 140 mm.

Fig. 3.—The piston is now at the bottom of the stroke; both sleeves are travelling upwards. The intake port is still about 3 mm. open to permit the continued entrance of gas into the cylinder through its own inertia. The ports then close immediately.

Fig. 4.—The piston is at the top of the stroke; both the inlet and exhaust ports in the inner sleeve are over the broad ring in the cylinder head, effectually making a compression tight chamber.

Fig. 5.

Fig. 6.

Fig. 7.

Fig. 8.

Diagrams showing the port openings in the Daimler engine. The solid black portions represent the port openings in the circular slide valves or sleeves.

Fig. 5.—This shows the opening of the exhaust ports, the firing stroke having been completed. The crank pin has described an arc of 125°. Both sleeves are travelling downwards, the inner much more rapidly than the outer one. The arrow shows the exhaust port opening by sliding off the broad compression ring on the cylinder head.

Fig. 6.—The piston is now at the bottom of its stroke, at which point the exhaust port opening is 5 x 140 mm.

Fig. 7 shows the maximum exhaust port opening which is 14 x 140 mm. The crank pin is now about 55° past the bottom centre.

Fig. 8.—The closing of the exhaust port is accomplished by the outer sleeve travelling downwards until the upper edge of the port closes over the lower edge of the exhaust chamber in the cylinder casting. The crank pin is now 20° over the top centre

The arrows in figs. 2, 5, and 7 are to draw attention to the positions of the sleeve ports, and not to indicate the flow of the gases, which in each case are in the opposite direction to that pointed by the arrow.

The Knight Engine for Motor Cycles.—

as it does for the piston, but it would take longer to free a Knight air-cooled engine than it would an ordinary engine.

Some Advantages of the Type.

One of the chief claims—and it was confirmed in the discussion following the above-mentioned paper—was the advantage gained by having the combustion chamber machined smooth all over, as also the top of the piston (which prevents carbon deposits forming quickly), also the absence of all pockets or valve spaces. The fit of the two sleeves, it was explained, bears no relation whatever to compression, but it was specially pointed out that distortion of the walls of ordinary cylinders having uneven thicknesses of metal causes loss of compression. Owing to the fact that the Knight engine cylinders are perfectly cylindrical, machined all over inside, and of perfect uniform thickness throughout, there is very much less likelihood of distortion taking place.

The inventor pointed out that after an engine has been run on the bench at the Daimler Works for a few hours under its own power, and thoroughly heated in order that the outer cylinder or water-jacket may go out of shape to the extreme limit, the motor is taken down and all points of distortion are found marked upon the walls of the cylinder by friction from the outer sleeve. These marks, which are the high portions, are then scraped away, but in the case of an ordinary petrol motor such scraping would cause a leakage of gas around the rings, owing to the cylinder distortion not being the same in all cases. It therefore appears as if it would be possible to make an ordinary air-cooled engine remain permanently compression tight by getting it extremely hot under its own power and afterwards grinding out the cylinder and fitting fractionally larger rings.

On the point of silence there is no question of doubt that the Knight engine scores.

On the point of vibration, as mentioned by a correspondent this week, we do not see how it can be any better balanced than an ordinary engine.

It accomplishes what has been the aim of practically every motor cycle engineer, viz., a rapid clearance of the exhaust gases, owing to the very large ports which are used. The inlet is equally free and rapid. To return to the question of lubrication, however satisfactory it may be on a water-cooled engine, it has yet to be proved whether this engine can be effectively lubricated when air-cooled and run at motor cycle speeds, say 2,500 r.p.m.

Another very important point from a motor cyclist's point of view which should not be overlooked is that

the Knight engine has a detachable combustion head. Now in previous motor cycle practice it has always been found that detachable combustion heads in the case of air-cooled engines gave trouble, owing to the fact that, however well the joint was made, the distortion of the combustion head caused leakages, and even with a good copper and asbestos washer between the head and the cylinder and very strong bolts a certain amount of the power was lost; but since the introduction of one-piece cylinders and combustion heads no trouble has been experienced in this direction.

In the Knight engine any possibility of leakage at the combustion head joint would not matter in the slightest, because by the time any leakage occurred at that point the compression would be lost by the gas passing the rings which are fitted on the separate combustion head. Mr. Knight informed the members of the R.A.C. that no such leakage could occur, and showed one of the broad rings, which is called a compression ring, which had been run between 15,000 and 16,000 miles this year. This ring is the lowest of the four rings on the combustion head shown in fig. 1, page 854.

A point that must not be overlooked in connection with motor cycle design is the height of the engine. The Knight, if constructed for motor cycles the same as it is for cars, must be slightly higher over all than an ordinary engine. The amount may be slight, but space must be provided for the working of the secondary shaft and connecting rods, and as the height of the frame and tank room is already defined by the height of the engine, and the frame is required in many cases to be still lower, and the tank room is barely sufficient, it appears as though a practically new type of frame would be required, at any rate to allow for removal of the cylinder leaving the rest of the engine *in situ*.

We must say that, having heard so much about the power developed by the Daimler engine, we are simply longing to try a motor cycle with the now famous "valveless" engine, because, owing to its greater flexibility, increased power, and silence, there is very little doubt that the same advantages will enable a motor cycle engine to be reduced considerably in weight while retaining the necessary power—items which motor cycle manufacturers have been striving to attain for some considerable time. The knowledge that Minerva Motors, Ltd., are considering the matter for motor cycles is quite enough proof that they have sufficient faith to make experiments, and if those experiments prove successful, our readers can rely upon receiving first intimation of the results through the medium of these pages.

A MAGNETO FOR 90° CYLINDERS.

FOR some considerable time the only ignition possible for engines with cylinders set at 90° was by coil and battery, or a separate magneto machine for each cylinder. The Bosch Magneto Co., Ltd., 23, Store Street, W.C., inform us that from time to time they have received enquiries for magnetos suitable for cylinders at 90°, but on account of the small demand it was decided that the expense would not warrant a special magneto being designed and made for the purpose. This type of

engine is increasing, and the Bosch Co. decided a short time ago to place a machine on the market suitable for these engines. Extremely satisfactory reports have been received from the few users who have purchased them, and it will doubtless interest readers owning engines with cylinders at 90° to know that a suitable magneto can now be obtained. The Bosch Magneto Co. will be pleased to reply through our columns or by letter to any questions raised with regard to this new machine.

SOME USEFUL ACCESSORIES.

(Concluded from page 835.)

Those who favour a bucket seat for motor cycles should examine the Whysall improved bucket seat, which is handled by the SERVICE CO., LTD., 292-293, High Holborn, London, W.C. It will be seen on reference to the illustration that the back rest is collapsible. It is brought into use at will by a Bowden lever attached to the handle-bar or steering wheel.

Whysall's seat with collapsible back-rest, operated by a Bowden wire from the handle-bar.

The moment the rider wishes to dismount he releases the catch of the handle-bar lever and the back rest falls in a horizontal position. This special seat was exhibited at the Stanley Show last November. Owing to unforeseen difficulties, however, there has been a little delay in putting it on the market, but now the Service Co. inform us they are able to give prompt delivery.

Front wheel stands are gradually gaining favour. The latest is the Ukantes, made by PRICE AND CO., 11, Mount Pleasant, E.C. The same principle is adopted in the new front wheel stand as is embodied in the older and better known type for the rear

A new Ukantes Front-wheel Stand shown in and out of action. It is made by Price & Co.

wheel, but, of course, the front stand is appreciably lighter than the rear one, owing to the fact that the legs are not called upon to support so much weight when in action. It is only intended to be used in the case of a puncture or some other repair or adjustment being necessary to the front wheel.

W. AND R. JACOBS, 39c, King William Street, E.C., have kindly placed at our disposal an extremely neat circular leather case for carrying a spare belt and inner tube on a motor cycle. The case measures 10 in.

in diameter by 2 3/8 in. deep, and is made of strong brown leather fitted with buckles and straps. In the centre is a hollow ring 4 1/4 in. in diameter, and the same depth as the box. Inside this ring a spare inner tube fits snugly, the belt being coiled around it. In the case of a belt of 1 in. section the best plan is to start the coil of belting from the inside, making the first coil fit as closely as possible to the exterior of the inner ring division. With any smaller size belt it is not necessary to go to this trouble. There is not the slightest doubt that spare belts and air tubes are far better protected when carried in this way,

Electary Tube and Belt Carrier.

and free from exposure to light and air. Air tubes and rubber belts are very much affected by light, and the rubber in both cases will be kept in much better condition packed up in a case such as the Electary.

Motor cyclists who have difficulty in starting their engines should experiment with a White economiser, which is also sold by W. and R. Jacobs. The economiser is to all intents and purposes a variable opening for the main air intake of the carburetting chamber. It simply consists of a metal cup pierced with holes to correspond with the usual air supply holes drilled in the carburetter base. The cup is fitted with a revolving disc so arranged that more or less air can be admitted, so increasing or decreasing the pull on the jet according to requirements.

Riders who are in the habit of using a paraffin or petrol syringe for washing out bearings, injecting thin oil into inaccessible parts, etc., will welcome the Model B petrol squirt introduced by the UNITED MOTOR INDUSTRIES, LTD., 45-46, Poland Street, Oxford Street, London, W. This article is splendidly made, the plunger being such a close fit that by screwing on the cap shown in the illustration, instead of the spout,

petrol may be carried in it for a day, and paraffin would probably stop in for a longer period. The special feature of this squirt is that the plunger is of metal. Other new U.M.I. accessories are the L.M. and L.M. de Luxe sparking plugs—the one for battery, the other for magneto ignition. These plugs are guaranteed from all defects, and may be readily distinguished by their orange coloured porcelains.

Among recent motor catalogues we have received is one issued by John Piggott, Ltd., 117-118, Cheapside, E.C. This firm makes a speciality of motor cyclists' clothing, and illustrated in the catalogue will also be found numerous articles of service to motor cyclists. Any reader contemplating the purchase of any accessories or clothing should not fail to send for a copy of this list.

Some Useful Accessories.—

The handy Gripple terminal was recently described and illustrated in *The Motor Cycle*, and we now understand from the MERKHAM TRADING CO., 9, Southampton Street, High Holborn, W.C., that a joint on similar lines has been introduced for connecting two broken portions of a wire cable without the use of solder. The same method of attachment is adopted as in the Gripple terminal. The two ends of the broken wire are threaded through the hole at either end of the metal block shown in the illustration. At the same time the wires are passed through the holes in the vertical blocks, and the latter are then firmly driven home and the ends burred over. The terminal is, of course, only applicable to bare cables which are not surrounded with the Bowden spring covering.

A useful little accessory has just been brought to our notice by Mr. William Lumsden, M.B.C.M. It is a clip which he has provisionally protected for holding a sparking plug for testing purposes. Every motor cyclist knows how difficult it is to get the sparking plug to lie loosely on the engine when testing the spark at the plug. The little device in question

overcomes this difficulty. The large screw thread of the sparking plug is grasped by the round end of the clip, and the narrow end is slipped on to one of the radiating fins. The plug is thus held with the sparking points upwards, and it can be readily seen whether a regular spark is occurring between the points, even while seated in the saddle and pedalling the engine. The clips are made by FERGUSON AND HOOD, Swan Street, Brechin.

G. T. RICHES AND CO., 19, Store Street, Tottenham Court Road, W.C., sell a large number of the Rich detachable air tube. This has been improved recently by the addition of a sleeve of rubber which fits over the joint. It will be seen on reference to the sketch that this rubber sleeve is tapered where it fits on to the air tube, and is made of thin and pliable indiarubber. It not only assists in making the joint air-tight, but also protects the joint from being chafed by the cover. Many motor cyclists use these air tubes with perfect success, and there is no doubt that they possess many advantages, not the least being the ease with which patches may be attached to the inside of the tube, where the air pressure assists in holding them in place, instead of having a tendency to blow them off.

Tandem Motor Bicycles.

By B. H. DAVIES.

I WISH to preface these notes with the statement that they include very little personal experience, a valued correspondent having asked me to edit his experiences for publication, in the belief that

there are a number of riders who would be glad to have a sample of this very cheap and efficient type of passenger machine built up for them by a local assembler, if they realised its possibilities. My correspondent, whom I will call X., always objected to the forecar, because he disliked projecting his passenger into dangers which he did not equally share, and because of the difficulties of finding a good triple track on the majority of roads. Thus he was left to choose between two wheels or four for his passenger work, and as four are always costly, he selected two. In 1904 he had a Clément-Garrard tandem built for him, as follows: 3½ h.p. Clément twin engine, 60 by 76 mm.; two-speed gear, with ratios of 3½ and 6½ to 1; ⅜ in. twisted hide belt; 2 in. Palmer tyres; and three brakes, viz., rear rim and coaster and front rim. The lady sat at the back, and the long belt was kept among the bottom tubes of the frame by a couple of jockey pulleys, one above and one below the belt. He had troubles with the details of the machine, especially with the gear, ignition, and lack of proper mudguard protection, but he says he found the tandem type had great advantages, viz.:

1. Entire freedom from side-slip.

2. General economy, especially in tyre wear and petrol.
3. Great comfort
4. Speed uphill.

Herr Relgner, who gained second place in a reliability trial at Belzig, near Berlin, on his Magnet Bicycle with rear tandem attachment.

Tandem Motor Bicycles.—

So for 1905 he made several alterations to the machine. The back pair of pedals and cranks were removed, and the pedal gear ratio was lowered to compensate for the loss of the passenger's assistance. This allowed good footboards to be fitted, and also a complete belt guard. Simultaneously the jockey pulleys were taken off, and the belt drive made direct. The passenger was now completely protected from mud. Her comfort was then further secured by substituting a Brooks spring seat for the cycle saddle, and adding a driving apron. Mechanical alterations consisted of a Rover automatic carburetter, a big rubber belt, the two-speed gear was scrapped as hopeless, and a new solid flywheel with fixed pulley, giving a gear of $5\frac{1}{4}$ to 1, turned out of solid steel. The transformation had extraordinary effects. The machine became infinitely more powerful up hills, overheating came to an end, the engine proved very flexible, and the passenger kept as clean as in a car, and enjoyed almost equal comfort. The sole defects were the absence of a two-speed gear for restarting on gradients, and rapid wear of the engine pulley.

An Inexpensive Passenger Machine.

So for 1906 further alterations were made, chief amongst which was the fitting of a Phoenix two-speed gear in the rear hub. Thanks to the small twin-cylinder engine, the big flywheel, and the long belt, all "consciousness of motor propulsion has been removed." The machine, always steady on grease, will now take any hill in England, and can crawl or restart in any traffic on the low gear. "The Phoenix two-speed gear has been a sealed box, into which I pump oil as directed, but it has required no other attention whatever during its three seasons of hard work." In touring off the main track, it is claimed to be superior to any other type of motor; it fears no hill, and can always find a clean, smooth track. Conversation is easy, and there is no fear of an upset if a tyre bursts, even though the deflation occurs on grease.

I can claim very little experience of tandem motor bicycles; indeed, barring short spins on old pattern Phoenix and Ormonde tandems, I am a novice with such things. But sundry deductions are inevitable from the above experiences. The first is that in a tandem we have a passenger machine which can be maintained for practically no more money than a solo machine. This fact alone, added to a low first cost, should make the vehicle attractive to those motor cyclists who, when they first take a girl in tow, cannot really afford the more expensive types of passenger mount. This is the cheapest of all to buy and to run.

Secondly, the tandem has been judged on the strength of a few obsolete types; as far as I know, not one machine has ever been turned out with a modern engine and modern magneto ignition. The frequent occurrence of detail troubles (especially in the ignition) which damned the early samples would be unknown on a 1909 tandem. Consequently I give a sample specification as an illustration of what could now be done in this line: Ladyback frame, 5 h.p. engine, magneto, spring forks, rin. belt, handle-bar controlled carburetter, $2\frac{1}{4}$ in. tyres, two belt rim brakes and one wheel rim brake, large tanks, mudguards, and footboards, with two-speed gear in rear hub. This machine would cost no more to run than a 5 h.p. twin solo, except that it would consume an extra quart of petrol every hundred miles, and that the rear tyre would last some 750 miles less. According to X., it would not side-slip, and would be free from vibration. It would climb absolutely any hill in England, and would travel a great deal faster than most ladies require. It would also be delightful to handle. The belt would wear as long as on a single, owing to its greater length, and minor troubles would only occur at the rate of about one stop per 1,000 miles. This is therefore a machine fraught with great possibilities for any rider who can steer a push-tandem, or cares first to learn to do so. A preparatory apprenticeship to the pedal tandem is certainly an essential, but such apprenticeship need not exceed five hundred miles; many men would need less.

AN ELECTRICALLY-DRIVEN TRICYCLE.

A WONDERFULLY neat tricycle shown in the accompanying line sketch was recently placed on the German market by Mr. Victor Harborn. Outwardly it resembles the Phana-mobile and the Cyclonette tricycles, which had engines over the front wheel, and steered through the medium of a tiller; but in the case of the Harborn tricycle electricity, and not petrol, furnishes the driving energy. The arrangement of the electro-motor and driving mechanism formed the subject of a recent patent (see *The Motor Cycle* of October 21st, 1908, page 832). The drive is transmitted from the motor to the wheel by means of a telescopic, universally jointed spindle, through bevel gearing. The frame is supported on laminated springs, and it is to allow of relative motion between the wheel and electro-motor that the driving spindle is made telescopic.

The tricycle will carry two persons over a distance of fifty-five miles on one charge, and its top speed is seventeen to eighteen miles per hour. The accumulators are carried under the seat, and can easily be taken out. The chassis is of sheet steel. A

hand lever and a foot brake suffice for the control, including travelling backwards and forwards and

braking. The type of vehicle illustrated is very popular in Germany, not the least advantage of the tricycle being its great stability in grease.

THREE SPECIAL SHOW ISSUES of "*The Motor Cycle*" will be published on the following dates: November 18th and 25th, and December 2nd.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Acetylene Gas Generators.

[3640.]—Replying to M. P. H. Meer's letter [3593] in *The Motor Cycle* of October 7th, I was a sufferer from the same trouble as himself some three years ago, and put the trouble down to the burner being slightly choked with soot, as the gas could not pass through and thus caused it to force its way through the water. The only satisfactory way I found out was to turn water full off as soon as the gas began to bubble through, the water thus causing the gas to take its proper course; then to light the lamp and turn water on again, and my trouble was ended.

T. W. VANN.

[3641.]—I note several correspondents are complaining about the Autoclipse generators. I had also a very unsatisfactory experience, but on reasoning the matter out I found the remedy very simple, viz.:

When gas is required the tap on top of generator must only be turned on a very little, as although it controls the gas it also regulates the amount of water which rises amongst the carbide, and on no account must it be turned on full, because if this is done the water immediately rushes up and generates more gas than the burner will pass, and the pressure becomes too great for the water to hold it in.

The whole secret is to open the tap very gradually until the required light is obtained. If these instructions are complied with the lamp can be lit as often as required until the carbide is finished. Provided the tap is turned full off there is no danger of the carbide being used up, and it is quite unnecessary to empty out the water when not in use.

I have found coated carbide as used in motor car lamps to be the most suitable for this type of generator. I trust readers will find this a satisfactory explanation. J.F.L.

Clutch Adjustment.

[3642.]—I notice there is a considerable amount of correspondence about the Roc clutch, and as a user of it I should like to give my experiences.

I bought a Roc machine early this year, and have now done about 2,000 miles on it, including a short tour. I have so far found the clutch to do all that is claimed for it, and that any slip can be taken up by the adjustment. At the left side of the hub there is a small rod controlling the high gear. By slacking away the small nut on this, and then unscrewing the rod about one and a half revolutions (sometimes less) I have always been able to stop any slip. A handy tip when this adjustment is nearly used up is to slip a small steel ball between the end of the rod and the cup-shaped end of the lever. This will prolong its range. A little oil does not seem to affect it, but on deliberately oiling, it slipped badly for a couple of miles and then settled to its grip again.

My low gear has failed to grip twice for the following reason: The links holding the loose end of the band reversed whilst riding. Not knowing this, I proceeded to take up the band about 2in., and was astonished to find it would not grip the drum even then. On finding out the cause, I returned the links to their proper positions, and had a stop fitted to the pedal. As this does not come too far back, the links could not pass the dead centre, and this stopped the trouble.

Perhaps this is "Enquirer's" trouble. I may say that I have no interest whatever in the Roc machine, except that of a satisfied user.

C. W. STILLMAN.

Sidecars and Side-slip.

[3643.]—I read Mr. B. H. Davies's article on sidecars in your issue of the 21st ult. with great interest, and welcome his appreciation of the Castor wheel sidecar all the more on account of the very outspoken way in which he writes of this and the other types. I should like, however, to point out that his opinion on the liability of the castor wheel to side-slip is in direct opposition to that of correspondents in *The Motor Cycle*. I give below the writers' names and dates upon which their letters appeared, and anyone interested can refer to the files: Mr. H. E. Hill, March 27th, 1907; Mr. Eric Longden, January 29th, 1908; Mr. W. C. Smart, June 3rd, 1908; Mr. J. W. C. Coulter, July 8th, 1908; Mr. W. B. Gibb, September 16th, 1908.

The above correspondents all refer to the Castor wheel machine, and confirm the opinions of others who have written privately.

May I also reassure Mr. Davies on the question of the strength of the frame? The makers assure me positively that they "have not had any failures whatever with the webbed lug referred to."

DOUGLAS LEECHMAN.

The Knight Slide Valve Engine.

[3644.]—I have been looking for weeks to see something about the Knight engine in *The Motor Cycle*. A week or two ago "Ixion" did have a little to say about it, but the most important part, I think, as far as cyclists or tricarists are concerned, is absence of vibration, and that is not mentioned by him. I suppose water cooling is absolutely necessary? This is no drawback to a tricycle or tricar or quad, and it seems to me that if all that is stated about the engine be true, an entirely new field is opened for any of the above owing to absence of vibration. I wish you would give us a good article on it. I am simply writing this letter to get someone to start the subject. I am a reader of *The Motor Cycle* from No. 1. BL 60.

[We have been waiting to hear something definite ourselves regarding the use of the above engine on motor cycles, and last week a letter from the Minerva Co. in these pages showed that they are considering it for motor cycles. This week an article will be found on pages 853-6, which deals with the mechanism of this revolutionary type of internal combustion motor.—Ed.]

Running on Benzol.

[3645.]—With reference to the discussion regarding running on benzol, I should like to say that I consider this fuel to be very good indeed. Since using it on a 1½ h.p. F.N., the power developed and speed attained have increased marvelously. The bicycle is geared 6¼ to 1 and driven by a flat belt, and it will attain 28 m.p.h. on the level. As for hill-climbing, it has climbed Shap from Carlisle without pedal assistance. The machine weighs about 110 lbs., rider and equipment about 150 lbs. The only alteration I made was to put a small weight on the float, as I found that, when adjusted for petrol, it did not start very easily with benzol, on account of the greater s.g. of the latter lifting the float and closing the valve sooner than was the case with petrol. By the way, I commend this tip to those gentlemen who recently discussed flooding of F.N. carburetters, only in this case the weight should be put on the needle spindle. About ½in. of No. 22 gauge lead or tin wire does the trick, and has the further merit of being easily adjusted.

Benzol can also be used with a surface carburetter, while in a spray, properly adjusted, it starts as easily as petrol in the coldest weather.

F.N. ENTHUSIAST.

Magnetising of Watches.

[3646].—I have had a rather curious experience with my watch, and should like to know if anyone else has been troubled the same way. About three weeks ago I sent the watch to be cleaned by the jewellers. Upon returning it they charged for cleaning and also demagnetising. As I have not been near any electric plant the only explanation I can offer for the watch becoming magnetic is that the motor cycle I ride has high tension magneto ignition, and as I have switch on the handle-bar to switch off the current, I almost invariably use this instead of raising the exhaust valve. I take it the current must go somewhere, and as the cycle is theoretically insulated from the ground by the rubber tyres, probably the current passes through one's body, and thus the watch might become magnetised. I am not sufficiently well up in electricity to know if this is correct, but I purpose getting a small rubber bag to carry my watch in for the future.

J. HUTCHINSON.

Passenger Work by Two-speed Gear and Otherwise.

[3647].—Your contributor's letter 3635 is full of significance, especially his remarks on change speed gears for passenger service. The importance of the sidecar question makes it expedient that prospective users of these handy little vehicles should better understand the utility and necessity of such improvements as, *e.g.*, wide belts (not less than lin.), reinforced frames (preferably duplex), strong spring forks of a design that eliminates any suspicion of lateral play, powerful and efficient brakes, the disposition of seats of a nature to approximate a sociable level, and the incorporation of an efficient clutch with two-speed gear. It is noticeable that conservatism and that habit which follows second nature has often been a barrier to a speedy conversion. This is exemplified, for instance, in the geared hand-starting clutch and speed gear refinements.

It is pleasing to realise the satisfaction which the movement, so steadfastly advocated in previous letters, has been testified to by innumerable riders of popular makes, and if I have any regret, it is to have been denied the opportunity to publicly demonstrate the gears and the simple manner of their adjustment—an invitation which has remained without response. I take it for granted that silence on the part of those concerned must be taken as proof that provision was not lacking for the maintenance and adjustment to the Roc device.

ARTHUR W. WALL.

A Problem to be Solved.

[3648].—Some time ago I gave you particulars with regard to a peculiar phenomenon in connection with my F.N. motor bicycle. This matter has been quite thoroughly discussed in *The Motor Cycle*, and many have been the theories put forward to account for the observed phenomenon. I have been studying this matter quite closely myself, and I believe that I have at last arrived at the solution of the problem.

When a F.N. four-cylinder motor bicycle is new it is unusually stiff. The gears are set up fairly tight, and the internal friction of the engine is considerable. After the machine has been run over 1,000 miles, and during this time properly oiled, the cylinder walls and piston rings become polished to the highest degree, and the transmission gears work much more freely. In other words, the internal friction of the engine and transmission has been reduced materially. It is only when the machine is in this condition that I have observed the abnormal phenomenon already described. Furthermore, my investigations have proved that, in order to obtain the abnormal state to which I have called attention, it is not necessary to have good compression in the cylinders when the engine is turned over slowly. I have found that the fastest F.N.'s are those which are not particularly good hill-climbers, on account of the fact that compression is poor. And yet these machines, after the engine obtains a certain speed, are very fast indeed. An accident led me to discover what I believe is the cause of the abnormal condition.

In order to increase the speed of my motor cycle I put compression plates on top of the pistons. I found that there were certain disadvantages to this practice and removed the compression plates, but instead of taking out the screws which held them to the top of the piston and brazing up the holes, I set the screws firmly, thinking that this would make the piston sufficiently compression tight. After assembling

the engine, and after using the machine for perhaps fifty miles, these screws evidently became loose, so loose, in fact, that when the machine was on the stand and I slowly revolved the rear wheel, it was difficult to detect that there was any compression at all in two of the cylinders. When I ran the machine on the road the two cylinders which had good compression developed normal power, while the two cylinders in which the screws were loose developed a very small amount of power, owing to the fact that the charge was blowing through the orifice. As I happened to be appointed courier on the Vanderbilt racecourse and needed to use the machine immediately, I was forced to ride it in the above-mentioned condition, that is, with two of the cylinders defective in the compression. What was my surprise to find after the engine heated up, and certainly when I was running down grade with the throttle wide open and spark advanced, I obtained very easily the abnormal condition, the satisfactory explanation of which has proved so elusive. I made several experiments and found that on the level I could not obtain a speed of much over thirty-five miles an hour. In other words, my two cylinders were in good working condition, and the machine received very little help from the two cylinders with defective compression. I found, however, after the engine reached a certain rotative speed, which could most easily be

A Johannesburg contractor sends home the above photograph, showing his 5 1/2 h.p. New Comet after colliding with a car. It will be noticed that only the forks are bent, no other part being damaged; in fact, the machine was run on the stand in the position as photographed. It speaks well for the material used by the maker, Mr. A. H. Haden, of Princep St., Birmingham.

obtained by running on full throttle down a grade, that the two cylinders with defective compression suddenly developed their normal power, and seemed to have as much power, in fact, as the two cylinders wherein the compression was good. This gave me an insight into the abnormal condition which my motor attains at times. I believe that when in this abnormal condition the compression of the motor is practically perfect, owing to the fact that *the engine has reached such a high rotative speed that the time element is not present which will permit the discharge leaking to any extent past the piston rings or valves.* In other words, at very high speed there is not sufficient time during the working stroke to allow an appreciable amount of the gases to escape past the valves or rings. In spite of the fact that the screws above mentioned were set comparatively loose in the cylinders, the leakage through the holes at the top of the pistons when the engine rotated at a high speed was comparatively small owing to the lack of this time element above mentioned. I believe, when my motor is in the abnormal condition which I have described, that the compression is unusually good owing to the fact that, on account of the high speed of the engine, the necessary time element or leakage is not present. I should like to hear what your readers have to say in response to my explanation of this phenomenon.

New York.

EARLE L. OVINGTON.

Touring in Norway.

[3649].—I was much interested in the photograph sent by Mr. C. H. Stephenson from Bergen, and the statement made by him that he had never seen a motor cycle in Norway (*The Motor Cycle*, September 23rd), and the more so that

I have just concluded a tour which included Christiania, over the Valdres Pass (3,600 metres) to Bergen. That is as far as the road went.

Our tour, after taking in the North of England, started from Calais, and included France, Belgium, Holland, Germany (Oldenberg and Schleswig-Holstein), Denmark, Sweden, and Norway. During the trip my machine was never in a repair shop, the cylinder has not been removed from the engine, nor have I broken a valve. All the distance except boat crossings was done on my motor cycle, and the machine never saw the inside of a railway van until we reached Voss, Norway, where the road ended seventy kilos. from Bergen. I can take the machine now as it is and do close to forty miles per hour on it on a straight stretch, almost as good as when I started. Between Christiania and Maristuen—the top of the pass—there was only one hill I could not take without pedalling, and that was so steep the pedals were of no assistance at all, and there was nothing to do but push.

As Mr. Stephenson says, the roads are good but narrow. Indeed, the roads show some of the finest engineering in the world, and the beauty of a tour in Norway—if you can find petrol—is that you can't get lost. Start on a road in the morning and ride all day and you've met no cross-road or fork.

It is inconvenient that there are no fences to the fields, for the horses hearing the strange noise of the motor exhaust invariably run on to the road in front, and all you can do is to drive them slowly before you till you meet someone who can drive them past you.

Our machines are of American manufacture, $3\frac{1}{2}$ h.p., m.o.v., chain drive with very effective slip sprocket, handle-bar control (no Bowden wire), double float multiple jet carburetter, 28in. wheels, $2\frac{1}{2}$ in. G and J. tyres, spring forks of course, ignition by dry battery and three cells (costing about 3s.), and last about 2,500 miles. The engine is incorporated as part of the frame. The name of the motor cycle is the Reading Standard, known as the "R.S.," and is, I believe, the most successful of American motor cycles.

From Norway we returned to London (there were four motor cyclists in the party), and are now returning from Scotland to Southampton to sail for America.

By the way, I might say that for a greater part of the trip my wife has ridden with me on a "back seat" attachment (sidecars won't do on American roads), thus doubling the weight, but to pedal on a hill was a rare happening.

In conclusion, while I am rather proud of the way the machine has done the work and faithfully, yet I must admit a great deal for your motor cycles here in England. In the first place, you have beaten us in comfort, for the frames are much lower and handier. You have larger and better cooling surfaces, though my engine has never overheated when my carburetter was kept right. I say "better" cooling surfaces with impunity, for in most American machines the cylinder flanges are turned, not cast. We have run away from many foreign machines, both single and twin, but we haven't yet run away from a Triumph, either on level or hill, and don't expect to. A firm that can build a machine like the Triumph or the Matchless possesses a quality of gray matter unusual and a perseverance worthy of a sound reward.

JACK KNEIFF.

Twin Engine Improvements.

[3650.]—Will you permit me to say a word or two in your valuable columns as regards twin engines?

"Enthusiast" has made some very true remarks in his "suggested improvements" about this type of engine, and the defects found in its present day form. The bearings on the average twin are certainly inadequate throughout, and I may pick out the big ends as extremely unsatisfactory. There being two of these side by side on a crank pin that is usually no longer or very little longer than in a single, they are much too short, also their centres are not in line with the centres of their gudgeon pin bushes, which cannot be good practice, as there is a tendency to jam. These objections can easily be done away with by slightly widening the crank case, which is no great matter, and forking one connecting rod to pass on either side of the other and giving it two bushes. This method brings the big end bushes central with those of the gudgeon pins, as anyone can see for himself. I think, too, that large well-designed ball bearings wherever possible would be ideal, giving a beautiful smoothness and flexibility. More care should be taken in balancing the

pistons, as this is a very easy job, and means so much in even running and power. Pistons should be as light as possible, and the greatest care used in ringing them and in fastening the gudgeon pins, which, in some motor cycles twins, or singles, are a perpetual source of worry. Rim fly wheels should be the rule, as these economise the width of the crank case, and enable the crank pin to be locked by a hexagon on each end, which is the best method. I am glad to say this is usual, as I have had several loose crank pins in cases where the heads are countersunk and fastened by four or five small screws.

Now we come to the most important point. Mechanical inlet valves are really indispensable. I have had experience with a.o.i.v. twins and m.o.i.v. twins, and there is no comparison between them. m.o.v. is obviously the thing, and it is most annoying to see the leading makers year after year bring out a.o.v. twins, which, although no doubt, when well tuned, are very good, are not, and cannot be, as fully efficient as they would be with m.o.v. Single-cylinder motor cycles, all motor cars, and the more go-ahead V twins have all abandoned the idea of a.o.v. Why then does the average maker of twins stick to it? It is as essential to have m.o.v. in a V twin as in anything, and more so than in a single cylinder machine. I need not state the many advantages of m.o.v., but if anyone replies to this, and asks them, I will. Meantime I hope to see automatics abandoned very soon.

"Enthusiast" favours a 5 h.p. (1) twin, 82 x 90, with a low compression. Of course, even with this low compression, it would be a good 7-8 h.p. machine, but I agree with him about it as an almost ideal machine.

There is one point much overlooked in twins, and in many singles, namely, good radiating fins. A $3\frac{1}{2}$ h.p. Triumph is above all else in this respect. Therefore, let our twin have fins as big and as numerous (especially over the valves), as a Triumph, and let them be as cleanly cast.

Many other points might be mentioned about design, but finally, let me say that the most satisfactory motor cycle to be obtained would be a good big twin as specified. Even in its present imperfection it is a far smoother machine, a better climber, and picks up much better than a single. M.O.I.V.

SUMMARY OF CORRESPONDENCE.

Mr. Chas. S. Lake, A.M.I.Mech.E., writes that on arrival at Doncaster one afternoon recently, after riding from London, he found that the front spindle of his 5 h.p. twin motor bicycle was broken. He called at two garages in the town, but was informed that they only catered for car owners. Eventually he reached the Racecourse Garage, owned and managed by Mr. W. M. Corcutt. Here he explained the difficulty, and although Mr. Corcutt was exceedingly busy, and had some repairs to a car to complete before the morning, he had the machine fetched from an hotel, and a new spindle made and fitted by seven o'clock the next morning.

A. W. Gamage, Ltd., writing on the subject of "Sparking Plugs and Compression Ratio," say: "We should like to inform Mr. Raymond Crawshaw, through your columns, that we think if he tries the Amia plug (which is specially made for high compression engines) he will find that his troubles are at an end. In fact, if he should buy one of these plugs from us and it went wrong we should be willing to refund the cost of it." Writing on the same subject, "O 2934" says he has found the Bosch magneto plug the most satisfactory for a high compression engine.

EXPERIENCES WANTED.

"Devonshire" would like readers' experiences of the Lowen two-wheeled sidecar, also the Nala two-speed hub with belt transmission.

"All Weather" would like readers' experiences with the 1908 four-cylinder F.N., particularly with regard to facility of starting on hills, and behaviour of carburetter.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

Puff Ferry, Norwich

Occasional Comments By Ixion

Some Yankee Notions.

I am interested to notice from the American cycle and motor journals that makers in the States are no slavish copyists. For instance, I find details of a twin-cylinder machine fitted with a separate miniature magneto for each cylinder, the idea probably being that when an ordinary type magneto has worn a little it is difficult for a novice to get the timing right in both cylinders.

Belt Fasteners.

I have now had time to test a number of belt fasteners, most of which are designed to alter the belt length when the loose flange of an adjustable pulley is screwed in or out. The simplest adjustable fastener I have tried is the Advance, consisting of an unequal-sided triangle, any side of which may act as the connecting link at will; with this the belt length is altered without removing the belt or even taking off one's glove. It is applicable to nearly every machine, but if there is only narrow clearance between belt and cranking of rear forks or between pulley and crank case on outside flywheel machines the projecting triangle may foul when the shortest side is acting as the connecting link. Then I have received two or three fasteners of standard pattern with loose hooks of different lengths; all of these work perfectly till worn out, but necessitate recourse to the vest pocket for a spare hook, and also require the removal of the belt. The Matchless adjustable fastener, sold by Collier Bros. and patented by Mr. Tassell, is a more complicated affair, but a first-rate article. Altogether 1908 has produced a crop of first-rate belt fasteners.

Valve Guide Removal.

I encountered a trouble the other day which was never met with in the early days, and of which several instances have come under my notice in this period of light engines. An exhaust valve buckled so badly that it could not be removed from the engine without unscrewing the valve guide. Many a happy-go-lucky motor cyclist has probably never examined the guide for his exhaust valve stem, which in some cases is screwed into the under side of his projecting valve box casting. On many engines it is impossible to remove this without first dismounting the cylinder, and even then it may be an arduous task, as the purchase provided for pliers or spanner is slight, the part exceedingly brittle, and after a thousand miles of running it gets very tightly bedded in its thread. The valve was so bent it could not be extracted through the valve cap hole in any way, and I soon saw I should have to unscrew the guide before the refractory part could be freed. The head of the guide was cast circular, with punch-holes drilled in it, and a few preliminary taps with a screw-hammer told me I should have to use something as ponderous as a coal-hammer to start it,

and that there was grave danger of a heavy blow cracking the guide and leaving me stranded by the roadside. Luckily, my mount had a cylinder that could be lifted off in six or seven minutes, and so off it came. Then I fished about in my kit till I unearthed a pin cone-key belonging to another machine, which luckily fitted the punch-holes exactly. I rained light tapping blows on the end of this cone-key as smartly as possible, and at last saw the abominable thing turn ever so slightly, after which a pair of gas pliers soon had it out. As it unscrewed the valve stem was pushed up through it, and finally drawn out through the cap hole. But this simple mischance delayed me threequarters of an hour. The buckling of the valve was due to the descent of a broken sparking plug porcelain into the cylinder.

A New Motor Cycle Magneto.

I was permitted last week to inspect a new magneto, samples of which are under test and consideration for next year by several leading motor cycle manufacturers. It has been designed throughout with a view to motor cycle use, and is admirably adapted for it. Its most interesting feature is the manner in which it has been made vibration-proof. I suspect its makers are in error in imagining that it is a common thing for bits of our magnetos to drop off and be lost, for I do not remember ever losing any portion of my magneto through vibration; and, indeed, I do not quite see what part could drop off without instantly stopping the engine, so that we should be sure to pull up quickly and find the missing piece. However, the body of this magneto is a single, solid casting, and the loose parts must be assembled in a fixed order, and when they are in place the contact-breaker cover slips on by a vibration-proof attachment, and solidly locks the whole together. If it be detached, the whole of the interior mechanism, contrariwise, can instantly be pulled out in one piece for examination.

Its detail improvements are very attractive. For instance, none of us liked the old fibre cams, with their marked liability to wear. At the same time, we dreaded to ask for steel cams, lest the bell crank should wear instead, and cause more serious trouble still. Well, on this magneto we have a steel cam, but, in addition, the heel of the bell crank is safeguarded from wear by the fact that it has a large steel ball threequarters sunk in it, which takes all the friction. In addition, the contact-breaker is ingeniously contrived so that the break of the points can under no circumstances exceed the correct maximum, while substantial means of changing or adjusting are provided. It is a very taking little magneto indeed. Incidentally, my eyes were opened to the numbers of motor cycles that are being made; I saw an order for five hundred magnetos from a firm whom I should not have credited with an annual output of half that number.

CURRENT CHAT

TIME TO LIGHT LAMPS

Nov. 4th ... 5.28 p.m.
 „ 7th ... 5.23 „
 „ 11th ... 5.17 „

Speed Limits in Hertfordshire.

Ten miles an hour speed limits will shortly be fixed in Redbourne, Markyate, Royston, Baldock, and Barnet. At a Local Government Board inquiry into an application for a ten miles limit by the above councils the Motor Union and the North Herts A.C. were represented by the secretary of the Motor Union. An application regarding Harpenden was opposed by the Union.

Motor Cycle Race at Toronto, Canada.

A big Marathon Race starting from the Exhibition Grounds, Toronto, was held on the 10th October, and during the time the competitors were away from the grounds a five miles motor cycle race for the Championship of Canada was run off, Maddigan (twin-cylinder Brown) winning by 200 yards, a rider of a twin-cylinder Curtis racer being second, twin Minerva third, and four-cylinder F.N. fourth.

State of the South Coast Roads.

A correspondent who rode from Portsmouth to Dover one day last week reports that the roads from Portsmouth to Chichester were fair but lumpy. Chichester to Arundel good. Arundel to Brighton very lumpy in places, and some very good stretches. Brighton to Lewes very good. Lewes

to Hastings good but loose in places. Over the Romney Marsh the roads were very good until near Folkestone, where they were lumpy, and very lumpy between Hythe and Folkestone. The remainder were in excellent condition, but owing to the rain of course somewhat muddy and greasy, and there was a lot of water on the roads in Romney Marsh.

Middlesex to Surrey via Kew.

Of the many bridges spanning the Thames connecting Middlesex with Surrey, undoubtedly the most free from traffic—in fact, at times it is totally deserted—is Kew Bridge, the finest and latest structure in the London suburbs. It is very wide, wood paved, and free from tramlines and motor 'buses, and furnishes a convenient route for motor cyclists who wish to reach the Portsmouth Road *via* Hammersmith. Motor cyclists, however, would do well to approach the bridge cautiously on the Middlesex side, there being a network of tramlines connecting with Brentford which are very treacherous on a wet day.

Successful Display of Fire Brigade Tricar.

An interesting public display of the novel motor tricar especially purchased by the Beckenham Fire Committee for

first aid purposes at fires was given last week in the Council's yard in the presence of Mr. H. S. Gear, the superintendent of the fire station, members of the Urban and Fire Committee, and other fire brigade officials. A wooden structure composed of inflammable materials was constructed, the alarm of fire given by a lady, and in thirty seconds the machine was started up at the station and driven up, the firemen then demonstrating the extinguishers, firemen's ladders, lines, etc., carried on the machine.

Police Traps.

The two miles trap on the Lincoln to Newark Road (about four miles out of Lincoln) is still in operation.

Four motor cyclists were fined at Stratford on the 24th ult. for excessive speeding over a measured furlong in Woodford Road, Wanstead.

We are advised by a correspondent that there is a police trap through Bromley. Exactly whereabouts in the town is not stated, and motorists passing through that district are warned to drive carefully.

Another on Watling Street, between Redgate and Atherstone.

A police trap is also working at a point about five miles on the Arundel side of Worthing.

Start of a motor cycle race on the Exhibition Track, Toronto, Canada, in which Brown motor cycles finished first, third, fourth, fifth, and sixth. The hills in the background represent Sebastapol, and hide Lake Ontario from view.

Address Wanted.

Will J. W. Chalfont kindly send the Editor his present address?

Show Issues of "The Motor Cycle."

Three special Stanley Show issues of *The Motor Cycle* will be published on the following dates: November 18th and 25th and December 2nd.

Manchester Motor Show.

The annual exhibition promoted by the Manchester and District Motor Trades' Association, Ltd., will include tricars, motor bicycles, and accessories. The exhibition will open on February 1st next and close on the 27th. All communications respecting this show should be sent to the secretary, Mr. W. H. Wheeler, Palatine Hotel, Victoria Street, Manchester.

The Last Hill-climb of the Year.

The last motor cycle hill-climb of the year was organised by the Edinburgh Motor Cycling Club, and no less than fifty-eight entries were received, which, it is believed, constitutes a record entry for Scotland. The organisers found a tough ascent in the Polton-Loanhead hill, which has gradients of 1 in 4 and several hairpin bends in addition. Forty-four riders, chiefly private owners, attempted the climb, but only half that number succeeded in reaching the top, which again drives home the necessity for a change-speed gear in winding climbs.

What Hastings Thinks.

A postcard from Mr. T. K. Hastings, of New York, says: "Best wishes from a 'Pro.' my penalty for competing—with the only sportsmen in the motor cycle world—my English friends."

A Stiff Climb.

A correspondent writes that it would be interesting to hear if Constitution Hill, Chatham, has been climbed by any rider of a motor cycle. The gradient is said to be 1 in 4½, it is a straight ascent, but on account of a right-angled bend at the foot it can only be taken from a stationary start. A successful climb on a motor cycle would probably call for a two-speed gear.

A Welsh Glenfinnart.

Mr. Hugh Gibson writes that he discovered a few weeks ago a Welsh Glenfinnart a few miles from Beddgelert. The climb lies between Pont Aberglaslyn, Rhyd, and Tan-y-Bwlch going to Maentwrog, and he feels positive no single geared motor bicycle could tackle the gradient owing to the hairpin turns and bad surface. Mr. Gibson climbed the hill without dismounting on his 5 h.p. two-speed Vindex, but used the low gear more than half the way up. He adds: "For grand scenery, hill-climbing, and plenty of fast stretches the following route will be hard to beat: Wrexham, Llangollen, Bettws-y-coed, Capel Curig, Beddgelert, Pont Aberglaslyn, Maentwrog, Festiniog, Bala, Corwen, Llandegla, Wrexham—120 miles."

Smell of Motors made him Dizzy.

"It's not drink. As soon as I get the smell from the motor cars I am drunk for a week after it. The smell is enough to kill me on the road," was the most amusing reply made by John Robert Lyall when he appeared before the West Hartlepool justices on Friday on a charge of having been drunk and disorderly. "Have you been smelling motor cars this morning?" enquired the Chairman (Mr. W. R. Owen), the remark no doubt being prompted by the defendant's volubility. "No, sir, thank God. I hope I shall never smell any more." The Magistrates' Clerk (Mr. Belk): "I have heard some objections to motor cars, but this is the latest." Defendant was fined 5s. and costs, and in reply to a charge of assaulting P.C. Corner, he said: "You can do what you like with me. I am sick of life and motor cars." He was sent to prison for a month.

220 miles 529 yards, and Martin's 244 miles 1,650 yards. At Celtic Park, Glasgow, this year, Martin beat the Scottish flying mile, doing 66s. on a four-lap track, and lowered the three miles record by 11½s.

The Hour Record Machine.

The actual 7 h.p. motor cycle on which C. R. Collier created the new world's hour record of over seventy miles will be exhibited at the Stanley.

The Six Hours Record.

We hear that an attack is shortly to be made on the six hours motor cycle track record held by H. Martin. One attempt to capture the record was made last week by H. C. Goodswain, but after twenty-two miles the back tyre burst, bringing the rider down rather heavily. He escaped with a shaking, and the machine was not damaged.

A Wise Policy.

In the last issue we referred to the fact that the Triumph Cycle Co., Ltd., have this year increased the dividend on their ordinary shares from five per cent. to seven and a half per cent. The balance sheet itself has now made its appearance and shows a nett profit of £22,048 after providing for depreciation, directors' fees, debenture interest, etc. We should like to take this opportunity of congratulating the Triumph Co. not only upon the results of the year's trading, but on account of the fact that they are only distributing the sum of £8,375 out of this profit in actual dividends. The directors of the company evidently intend that the foundations of the firm shall be absolutely secure, and if more companies adopted this conserva-

tive policy in the distribution of dividends until such items as goodwill have been entirely eliminated, they would have less difficulty in weathering the periods of bad trade when they occur.

Hill-climbing.

A Birmingham motor cyclist (A 4726) writes that he and a friend rode over to a hill named Farlow Bank, near Cleobury Mortimer, Salop, a month or two ago, and seeing some discussion on hill-climbing he emphatically states that the rise is unclimbable on a single-gear motor bicycle. He even goes further and states the hill is too much for the majority of two-speeders. It is estimated at half a mile long, with very severe gradients and the usual hairpin bend followed by a stretch of at least 1 in 4 with loose surface. Our correspondent has mounted Birdlip and Sunrising hills on his machine with ease, but cannot get anywhere near the top of Farlow Bank.

THE NEW PENNY EDITION OF "THE AUTOCAR."

Readers of "The Motor Cycle" who are interested in motor cars are reminded of the new Penny Edition of "The Autocar," now obtainable of all Newsagents and Booksellers every Friday Morning.

FUTURE EVENTS.

- Nov. 5—Paper before members of the Auto Cycle Union, "Tricars—Dead, Living, and Unborn," by Mr. Basil H. Davies, at 112, Piccadilly, W., 8 p.m.
- " 6—Stanley C.C. Annual Smoking Concert.
- " 13-21—OLYMPIA AUTOMOBILE EXHIBITION.
- " 18—Motor Union Annual Dinner at the Hotel Great Central, London.
- " 20-28—THIRTY-SECOND ANNUAL STANLEY SHOW, at the Agricultural Hall, Islington.
- " 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.
- Dec. 16—Motor Union General Committee Meeting.
- Jan. 16-23—Motor Cycle Show at Madison Square Garden, New York.

Martin's Successes in 1908.

Harry Martin was the first English motor cyclist to cover a mile a minute on a motor cycle, which he did in the Gordon-Bennett speed trials at Phoenix Park, Dublin, as long ago as 1903. At that time he rode an Excelsior motor bicycle. He is the present owner of the world's 200 miles record, also the four, five, and six hours records, which he created on April 13th this year, on a 3½ h.p. Matchless-J.A.P. The previ-

ous British record was held by Chase, and the Continental record by Anzani. Anzani's mileage in the six hours was

A NEW ENGINE.

THE Quadrant Motor Co., Coventry, have been at work for some time on a new design of engine, which we had the pleasure of examining one day last week. Reference to the illustration will show that the exhaust and inlet valves are situated fore and aft instead of at one side, both the exhaust port and pipe being covered with radiators to secure more efficient cooling. Owing to the exhaust port being in front there is a continuous current of air playing upon it, and the inlet port being at the rear, and as far removed as possible from the hot exhaust, the gases entering the cylinder are thereby kept cooler, and consequently not expanded to such an extent as when heated by close proximity to the exhaust valve. The carburetter is attached quite close to the cylinder, as will be seen in the illustration. As far as motor cycle engines are concerned, we believe the method of construction adopted for the crank case is novel, and quite a departure from previous practice. The crank case has no central vertical or horizontal joint, but is cast in one piece and open at one side, on to which fits a plate carrying the timing gear wheels and the magneto transmission. A second or covering plate fits over the gearing and magneto drive, and a compartment is thus formed in which the gears run perfectly lubricated and dust proof. An advantage of this arrangement is that when the two plates are removed, it is possible to withdraw the whole of the reciprocating parts without taking the engine out of the frame.

An Unusual Type of Piston Ring.

The piston is fitted with a special ring which is uniform in depth and thickness over all its circumference. That is to say, it is not turned eccentric, but obtains the necessary spring in another manner. A ring of this type bears more equally on the walls of the cylinder than those made thick in one part and thin in another. There is also less likelihood for burnt oil and other residue to get behind the rings. The magneto is fixed on a platform which is cast with the crank case, and the situation of the magneto behind the engine affords protection against mud and dust thrown up by the front wheel. The cams operating the valves are fitted inside the crank case, and are accordingly thoroughly lubricated. The cams are so shaped that the valves open quickly to the fullest extent.

The number of events won during the year by riders of motor cycles fitted with Dunlop tyres is truly phenomenal. Commencing with the performance of Mr. W. G. McMinnies on Feb. 25th, when he covered a flying half-mile at the rate of 58.8 miles per hour on Brooklands Track, and closing with Mr. C. R. Collier's hour record on the same track on October 8th, there has been a long list of wins on road and track by riders of machines fitted with

remain open the longest possible time, and close quickly. Both valve tappets are adjustable for length, so that wear, which usually necessitates a new valve or tappet rod, can be taken up and the correct distance between the valve stem and tappet maintained. The attachment of the silencer is so arranged that there is no flange or obstruction inside the pipe between the valve port and the silencer. This is obtained by means of a coned joint. The carburetter is the same Quadrant semi-automatic carburetter controlled by one lever which

The 1909 Quadrant engine, described in the accompanying article.

has been used with satisfactory results during 1908. The carburetting chamber is very simply constructed. The additional air openings are formed by vertical slots, which can be covered more or less by means of a slide to suit the atmosphere of any particular day or the difference between midday heat and the cool of the evening. Once adjusted correctly, the piston throttle when opened and closed governs the supply of air through the vertical slots in proportion to the amount of throttle opening. The new Quadrant engine will be exhibited at the Stanley Show in a new frame, which, we understand, will also possess some novel features. Visitors to the show should not fail to examine this most interesting engine. The designer, Mr. T. Silver, has had considerable practical experience of motor cycle racing and touring, and, aided by the staff of the Quadrant Motor Co., can be relied upon to produce an article which will do all that is claimed for it.

Dunlops—in fact, we can hardly remember an important hill-climbing competition or race meeting where these tyres have not been successful. Both the brothers Collier invariably use Dunlops, and their successes have doubtless induced other riders to adopt them. We cannot conclude this *résumé* without mentioning the Auto Cycle Tourist Trophy Race, when Dunlop tyred machines finished first, second, and third in the single-cylinder class.

Bradford M.C.C.

A team competition is to be run on November 8th. The route is from the bottom of Holling's Hill to Leeming Bar and back. The teams are to consist of three riders each, and unless there is an entry of five teams the competition will be void.

Birmingham M.C.C.

The committee has decided to conduct a series of autumn reliability trials to prove the reliability of members' machines on the same lines as those held last year. The competition will take the form of an ordinary non-stop run on the occasion of the club run to Stratford on November 7th. If any competitors are left in at the conclusion of that run they will again compete on the following Saturday's club run, and so on week by week, if necessary, until only one competitor is left in. The last competitor left in will receive the first prize, and the last but one second prize, and so on. Provided there are ten or more entries received the following prizes will be given: First prize, barometer, kindly presented by Mr. Faithful Ash; second, prize value £1 1s., presented by Mr. J. A. Holder; third, prize value 10s. 6d., given by the club; first man out, wooden spoon, value unknown.

Edinburgh M.C.C.

Perhaps the most successful competition organised by this club was held on the 24th ult., in the form of a hill-climbing contest on the Polton-Loanhead Hill. No less than 58 entries were received, and of these 44 actually competed, but only 20 ascended the hill successfully. This will give an idea of its severity, the gradient being 1 in 4 in a few places, but the real difficulty was the hairpin bends, which were the undoing of several of the competitors, including two Tourist Trophy riders, Messrs. Gibson and Baxter. There were a great many spectators, but the organisation was such that none of the competitors were inconvenienced in the slightest.

The following are the official results. X represents the fastest time in each class, and the number of seconds represents how much others were behind the fastest time.

The lightweight class (handicap for cycles under 120 lbs., pedalling allowed) and the passenger class (handicap) were not run off owing to lack of sufficient entries to constitute a class.

Multi-cylinder Class (Handicap).

Fig. of merit.

J. R. Alexander (5 h.p. Vindec Special) ...	951	X
P. E. Tolfree (5 h.p. Roc, two-speed) ...	1,292	17 $\frac{4}{5}$ s.
J. F. Morrison (5 h.p. Vindec) ...	1,338	10s.
J. G. Stewart (5 h.p. Vindec) ...	1,375	17 $\frac{1}{5}$ s.
J. McNeill (6 h.p. N.S.U.) ...	2,040	11 $\frac{3}{5}$ s.

Others failed on hill.

Machines made in 1905 and previous thereto, pedalling allowed (scratch).

A. H. Alexander (5 h.p. Alex) ...	X
A. Cairns (3 h.p. Bradbury) ...	29 $\frac{4}{5}$ s.

Others failed on hill.

Unlimited Capacity Class (Scratch).

J. R. Alexander (5 h.p. Vindec Special) ...	X
S. J. Thomson (3 $\frac{1}{2}$ h.p. Triumph) ...	7 $\frac{4}{5}$ s.
A. H. Alexander (3 $\frac{1}{2}$ h.p. Griffon) ...	8 $\frac{2}{5}$ s.
J. F. Morrison (5 h.p. Vindec) ...	10 $\frac{3}{5}$ s.
J. Cameron (3 $\frac{1}{2}$ h.p. Triumph) ...	14 $\frac{4}{5}$ s.
J. G. Stewart (5 h.p. Vindec) ...	17 $\frac{4}{5}$ s.
P. E. Tolfree (5 h.p. Roc) ...	18s.

Others failed on hill.

The results in the single-cylinder class have not yet been decided, two competitors finishing so close together that the matter is being gone into again.

Cambridge University M.C.C.

The above club held a speed-judging competition on Saturday, October 24th. The competitors (nine in number) drew lots for their speeds, which ranged from fifteen to twenty miles per hour. The distance over which they were timed was seven miles long. The results were as follows:

1. J. M. Oakey (5 h.p. Vindec Special).
2. F. P. Dickson (5 h.p. Vindec Special) and V. F. N. Oliver (5 $\frac{1}{2}$ h.p. G.B.)
3. N. Hutchinson (3 $\frac{1}{2}$ h.p. Triumph).

Bocardo M.C.C. (Oxford).

The challenge cup competition, consisting of a test of reliability and driving to schedule time between controls, took place on Thursday, the 22nd ult., and the winner proved to be Mr. Frank Barton, riding a twin Rex.

Oxford Bocardo M.C.C. members on the occasion of a speed-judging competition.

AUTO CYCLE UNION NOTES.

TRICARS.—Motor cyclists interested in tricars should make an effort to attend the paper on "Tricars—Dead, Living, and Unborn," which is to be given by Mr. Basil H. Davies before the members of the Auto Cycle Union, at 112, Piccadilly, London, W., to-morrow (Thursday) evening, at 8 o'clock. A ticket of admission can be obtained upon immediate application to the Secretary, Auto Cycle Union, 18, Down Street, Piccadilly, W.

HORSE-POWER RATING FOR MOTOR CYCLES.—The Formula Sub-committee of the Auto Cycle Union at a recent meeting discussed the question of horse-power rating for motor cycle engines. In view of the fact that the Society of Motor Manufacturers and Traders has prepared a horse-power formula which is being discussed by various technical bodies, and which seems likely to be adopted for the rating of petrol engines of all sizes, the committee hope to make definite recommendations as to the substitution of this formula in place of the cubical capacity formula hitherto used for hill-climbs, in time for next year's competitions.

MOTOR CYCLE INSURANCE.—The Auto Cycle Union has arranged a special "Auto Cycle Union" policy with the Car and General Insurance Corporation, by which members may for a premium of 10s. 6d. per annum be covered against fire and claims by the public. Full particulars of this policy may be obtained upon application to the Secretary, Auto Cycle Union, 18, Down Street, Piccadilly, W.

"THE AUTOCAR" LECTURES.

FOUR of these lectures have now been given in the London and two in each of the provincial centres. The dates of the remaining lectures in each centre are as follows:

LONDON.—3.30 and 8.30 p.m. November 10th, 17th, 24th, and December 1st.

BIRMINGHAM.—7.30 p.m. November 4th, 11th, 18th, 25th, December 2nd and 9th.

LEEDS.—7.30 p.m. November 5th, 12th, 19th, 26th, December 3rd and 10th.

MANCHESTER.—4.0 and 7.30 p.m. November 6th, 13th, 20th, 27th, December 4th and 11th.

NEWCASTLE-ON-TYNE.—7.30 p.m. November 9th, 16th, 23rd, 30th, December 7th and 14th.

The various phases of the subject will be dealt with in the following order:

THIRD LECTURE.—Generally speaking, will deal with the engine and all the component parts thereof—Crankshafts—Connecting Rods—Pistons—Valves—Camshafts—the Shape of Cylinders and the Position of the Valves—with a few remarks on Motor Cycles.

FOURTH LECTURE.—Clutches: Cone, Expanding, Metal-to-metal, disc, etc.—Gear Boxes—Cardan-shafts—Universal Joints—Back Axles.

FIFTH LECTURE.—Carburation—Cooling and Lubrication.

SIXTH LECTURE.—The whole of this lecture will be devoted to various forms of ignition, particular attention being given to High Tension Distributing Systems and Magnetos.

SEVENTH LECTURE.—Frames—Steering—Brakes—Bearing Chains, etc.

EIGHTH LECTURE.—Bodies—Wheels—Tyres—Accessories—Hints on Driving—Organisation.

We draw special attention to the fact that to meet the wishes of some of our readers it has been arranged to issue tickets to admit to *any four* of these lectures at a fee of 10s. 6d. We strongly urge all those who have not yet applied to take advantage of the opportunity now afforded them of gaining a knowledge of the mechanism of a car.

Applications for tickets should be made immediately to the Lecture Secretary, 20, Tudor Street, E.C.

PREPARATIONS FOR WINTER.

THE rider who faces winter work on the system of changing things is likely to have a weary time. The most exasperating and most probable trouble of all is belt slip. The canvas and rubber belts, which are the favourites of to-day, break up very suddenly when their last day is near, and a new one is advisable in the autumn, the old one being carried as a spare. In shortening, care should be taken to get the new hole both central and vertical, which can only be done with certainty by using a drill punch of the right size. The addition of a single extra precaution makes it absolutely certain that even a 200 miles run can be made without a belt stoppage; and the remaining precaution is the truing up of the groove of the engine pulley, which is sure to be several degrees out after the summer's work. Wear of this pulley probably accounts for the permanent slip with rubber belts which some riders complain of in rainy weather.

A Good All-round Gear is 4½ or 5 to 1.

Belt stoppages being thus written off the list, tyre stops are the next chief item. My experience is that punctures are uncommon in winter, perhaps because such articles as nails are less likely to find a hard bit of ground on which to get a purchase against the tyre. The covers should be dismantled, and patched or plugged where necessary. The rims should be examined for projecting spoke heads, all rust sand-papered off, and a coat of enamel applied. The tubes should be well tested in water, and new valve rubbers fitted; all dubious patches should be removed and re-made. A couple of rubber studded treads should then be professionally vulcanised on the old covers.

The ignition is the next point likely to give trouble. The magneto must be provided with a proper cover, or if accumulators be used some form of guard over the contact breaker is advisable; otherwise any heavy road will be fertile of ignition stops. It is impossible to devise a picturesque contact breaker guard, but a little amateur tinkering with sheet rubber, sheet tin, or patent leather will prevent "shorts." Once I elaborately bent up two shaped pieces of tin, fastened one rounded piece on the three front crank case bolts, projecting out across the path of travel, and fastened another

flat piece to project horizontally from the top of the crank case, with a slot in it for the ignition rod to travel in. It looked ugly, but was most useful, for it kept off rain from above and mud from beneath. Only the sparking plugs remain to be dealt with. I cut out a disc of thin cycle patching rubber some 6in. in diameter. A tiny hole is cut in the centre of this, and it is then threaded over the plug terminal before the high-tension wire is attached. It falls down around the plug body, and a rubber loop being slipped over entirely prevents short circuits by rain or mud.

Leaving the machine, we now come to the rider. I used to recommend hobnails, but I now use snow overboots, for the sake of warmth, and find their ribbed rubber soles quite proof against human side-slip in mounting. Rolled earflaps are essential in frost, and the cap should have a thick peak, or else headaches will result; a wad of cottonwool inside an ordinary tweed cap is all right. Very thick ordinary clothing is still used by many riders, but, however ugly leather may look, there is nothing like it for resisting wind. I use a Harris tweed reefer jacket, lined with leather, which is splendid. Waterproofs to go over all cannot be dispensed with, and there are plenty of good proofed jackets and capes. I have begun to use a plain pair of waterproofed trousers, fitting very slackly indeed. A number ten size boot with an overshoe on it can be thrust through these without danger to the fabric, and a pair of trouser clips afterwards slipped on to keep the slack away from the belt; this dodge looks ugly, but I find it is best. I have tried many sorts of gloves, but never owned a pair that were really warm, and this winter I intend to wear quite a light glove and to use handle-bar muffs. Really thick hand protection is only wanted when actually riding, and it therefore strikes me as sense to keep it permanently fixed to the bars. To wear very thick gloves when dismounted is as foolish as it would be for a car driver to have his glass screen fixed on a wire clip round his neck.

I repeat by way of conclusion that no rider should lay up his machine for the winter until he has tried at least one long run on a modern machine with studded tyres over muddy roads.

MUD PLUGGER.

QUESTIONS & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E. C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Fitting Footboards.

? Please inform me if footboards can be conveniently fitted to a 1908 Triumph, and how and where procurable? I favour them because they allow one to change the position of the feet continually, and there is no wild dash for the pedal when mounting by running alongside.—J.G.

There should be no difficulty in fitting footboards to your machine. It is, however, a matter for an intelligent local cycle maker. Patent folding footboards can be obtained from W. C. Unwin, Arle Court, Cheltenham. We agree with your remarks.

Thick Oil and Difficulty in Starting.

? I have recently bought a $3\frac{1}{2}$ h.p. machine and find it a great success but for one thing. After standing for a very little while the oil or something congeals in the cylinder, the result being that it takes me an awful time to start the engine again, even after injecting plenty of paraffin. I use Price's Motorina B oil. Could you tell me any way of overcoming this difficulty?—A.S.L.

The trouble might be overcome by using a heavy water-cooled oil during the cold weather, which would be thinner than the oil you are at present using.

Improving Petrol Consumption.

? I am riding a 5 h.p. Peugeot and think that by experimenting I ought to do more miles to a gallon of petrol than at present (about eighty). Will you please advise me what I could do to improve this? Would I be able to do more miles on heavier spirit (Borneo) or less? Is a short lift on the inlets with a light spring better than a longer lift and stronger spring? My present gear is $4\frac{1}{2}$ to 1.—ECONOMIST, Acton.

The petrol consumption is really very good for a 5 h.p. twin-cylinder machine, and we should not advise you to try to interfere with the adjustments. If you use heavier spirit you may have trouble in starting, and you may have to alter your carburetter, which would not be desirable. A small lift is better, as it reduces the wear and tear of the valves. A fairly strong spring is desirable for fast running.

Belt Twisting on Pulleys.

? I have just fitted a new Stanley Dermatine rubber and canvas belt to my 3 h.p. Rover, but after running two or three miles this will insist on twisting (not coming off), so that the V-section is facing the engine all the way round. The belt is a $\frac{5}{8}$ in. one, it is kept pretty tight, and the pulleys seem to be in perfect line. I would mention that the old leather belt never used to serve me this trick.—AN 159.

The trouble is due either to the belt and grooves of the pulleys not being of the correct angle, viz., 28° , or the pulleys are not in line.

Heated Crank Case.

? I purchased a twin Rex motor cycle twelve months ago, and after tuning it up it was a real marvel, making fastest time in a hill-climb. For some little time there has been a very marked loss of power and bad running which I am unable to remedy. One symptom, that of an exceptionally hot crankcase, and the engine pulley getting so hot as to be unable to bear the hand on it, seems to me to point to worn cylinder, yet when the cylinder is taken off the piston rings are bright all round and show no trace of the gas getting past. I have had the engine shaft bored, but find little or no better results. Do you think any remedy would be found in fitting new rings, or is it a case necessitating reboring and new pistons? All my tests with carburetter combinations and a.o.i.v. springs result in no improvement. Compression is not good.—W.W.

We take it that you have ground in the valves, and as you say the compression is not good, it is almost certain that the leakage is past the piston rings, which accounts for the crankcase becoming so hot. After continued running the valve springs become weak, especially the exhaust, and we should advise you to replace these with new ones. If after renewing the rings the crankcase still becomes excessively hot, have the engine overhauled without delay. There is always a certain amount of heat in a crankcase after running the engine, due to conduction.

Clutch for Starting and Speedometers.

? (1.) As a result of careful enquiry among friends during the last eight months I have now purchased a 1908 Triumph motor bicycle, and have already derived much enjoyment from its use. Unfortunately, I am no longer as athletic as I used to be, and I find starting and mounting rather a difficulty. Consequently I am contemplating the purchase of a free engine clutch, and should like your advice on the subject. I am thinking of fitting the Mabon clutch. Is it reliable? (2.) I also wish to fit a speedometer. Are these instruments reliable?—W.B.K.

(1.) There is very little to go wrong in a clutch, and we think would be quite as reliable as any other part of a machine. If you purchase the clutch mentioned you will be able to start quite easily. (2.) A good speed indicator is a reliable and interesting accessory, but with your make of machine those driven by a wheel in contact with the tyre would not be accurate owing to the design of the spring forks.

Fitting a Magneto Switch.

? Please let me know if I fit a switch on magneto whether it will do the magneto any harm? I am told it does. I thought if I fitted a switch it would help a little to keep engine cool, as when running downhill I should switch off and lift exhaust valve, when there would not be any spark in engine, and therefore the heat from the spark would be saved.—G.N.C.

The idea that fitting a switch will do harm to the magneto is quite erroneous. If properly fitted it will do no harm at all. Above the contact breaker there is a steel screw which must be connected by means of a piece of low tension wire to the switch. Examine the switch and see how it is marked. If the wire is connected to the frame through the switch, the magneto will be put out of action. In some switches this is called the "on" position. If you move it to the "off" position so that the wire is not connected the magneto will be in working order. If no explosion occurs in the cylinder the spark will not affect the temperature of the engine.

Higher Petrol Level Increases Consumption.

? Some little time ago I had occasion to alter my Longuemare carburetter so as to make the petrol rise higher in the jet.

I did this by weighting the float. The petrol now rises to the correct level, viz., the bottom of the cone. I have to complain of my petrol consumption, which comes out at fifty miles per gallon, 5 h.p. Riley tricar, engine 86 by 89 mm. Is this not far too much petrol? I drive carefully, and give all air the engine can possibly run with. Would it make any difference if I had raised petrol level by altering the weight on the needle instead of weighting the float? Both methods will raise the level of petrol, but would there be a difference in the two methods?—A.L.

The fact that you have raised the level of the petrol accounts for the difference in consumption. The only thing you can do now is to use a smaller jet, but if this affects the efficiency of the engine in any way, we should recommend you to leave things as they are, as slight extravagance of consumption in petrol does not entail much extra expense.

Accumulator Sulphated and Carburetter Flooding.

? (1.) How can I improve my accumulator? It is a Minerva, and was bought second-hand with the machine, and I am told is badly sulphated. The terminals inside the accumulator and also the outside plates are a grey colour (charged or run down). It ran me 500 miles and then ran down rapidly. When charged again I got 100 miles out of it, but it indicates 3.7 volts. (2.) As to carburation. Engine Minerva 3½ h.p. 1906, Longuemare, spray No. 8, one slot soldered up. The engine runs well and I can get 100 miles per gallon (with two months' experience), but the carburetter floods if the tank tap is turned full on, so I have to experiment each run until it just lets sufficient spirit through and no more. To correct level, ought the weight to be pushed nearer or farther from the needle point, and also (3) the engine will take hardly any extra air with the spark advanced; throttle just open it will take about ¼ in., but uphill or on bursts I cannot get it to take any more. If I open more the engine slackens as if the gas was turned off.

—A.B.H.

(1.) A cell which has begun to sulphate may be improved by adding a little sodium carbonate to the acid. The proper proportion is about one ounce of carbonate to one gallon of the acid solution. To prevent sulphating a charge extending over two hours at least should be given every fortnight when the accumulator is not in regular use. You had better then charge slowly at the rate of one ampère. Invaluable hints on the treatment of accumulators are to be found in "Motor Cycles and How to Manage Them," which can be obtained price 1s. 2d. post free from these offices. The charging should be carried out two or three times in succession, and very little current should be taken out of the cells after each

charge. (2.) To lower the level the weight should be moved further from the needle point. (See notes on carburetter adjustment in "Motor Cycles and How to Manage Them.") (3.) Probably after you have altered the level you will be able to get the engine to take more air.

Slow Running and Battery Ignition.

? (1.) I have just purchased an old 3½ h.p. Rex motor cycle, accumulator ignition, with Longuemare carburetter. The trouble is that it will not run slowly, it stops completely if spark is not well advanced. The people I bought it from tell me that it is due to the engine being a high speed one, which to me (a novice) appears a very poor reason. Can you tell me if it is so? If not, why? Will a new handle-bar-controlled carburetter make any difference? (2.) Do you recommend dry battery for ignition purposes? If so, any particular brand? —E.H.

(1.) The difficulty in running slowly is probably due to the carburetter alone, which possibly takes too much air at slow speeds, hence a smaller choke tube and an extra air inlet might help matters. To run slowly you should retard the spark fully, close off the extra air entirely, and then close the throttle as much as possible. You would be able to manipulate handle-bar control levers much better than levers on the tank. (2.) A dry battery is likely to be satisfactory if a plain coil is used. A trembler coil is too extravagant. You can obtain the Hellesen or the Siemens dry batteries.

Tuning up an Old Pattern Machine.

? Six months ago I bought a second-hand 2½ h.p. Fleet Ariel which was somewhat out of order. I fitted two new piston rings, ground in valves, also new wires and terminals, and have made several other adjustments, but have never been able to get it up Barnet Hill without some pedalling. There seems plenty of compression, as it will bear my weight (twelve stones) on the pedal for a few seconds. The belt does not slip. I have tried all manner of adjustments of carburetter (Brown and Barlow), but cannot get any better results. The spark occurs when fully advanced exactly as the piston reaches top of cylinder. The engine starts off quite easily. I can make it roar on the stand, and it will go well on the level, but directly I come to a hill it seems to lose power, and every now and then there is a peculiar kind of blowback which soon brings the machine to a standstill unless I pedal. This occurs just the same whether the spark lever is fully advanced or only half-way. The ignition seems perfect, as I cannot detect any misfire. I have just fitted an adjustable pulley, and have geared it 6 to 1. Do you think the engine is timed wrongly, or am I expecting too much power out of a 2½ h.p. for my weight?—H.D.

With a 6 to 1 gear the machine in question should climb Barnet Hill easily. It appears as if the carburetter has

some room for improvement, the ignition is also timed too late. The adjustment of the air supply is very important in hill-climbing. When a machine begins to slow down on a hill it is necessary to close off the air supply in order to enrich the mixture, or a blowback will occur. Probably the level of the petrol is not quite correct. We should therefore recommend you to take the machine to the best repairer you know of, and get him to make the final tuning operations for you. It will cost very little.

An Occasional Misfire

? Kindly tell me why my 3½ h.p. twin-cylinder Peugeot misfires at speed; it fires perfectly when running slowly uphill. I have tried all the tips mentioned in "Questions and Replies" without being able to stop mine. I have had new contacts fitted, tried different strengths of inlet springs, increased and reduced top air inlet, and packed slits round valve caps. I find the front cylinder gets a much better mixture than the back, and it is in this cylinder where the most misfiring occurs. I may say the top air intake is fitted directly in the centre of the main induction pipe, and the carburetter is between the cylinders.—R.F.A.

You omit to state whether the ignition is by accumulator or magneto. If the former, it is quite possible that the reason of the misfiring is due to the coil not being fast enough. Many trembler coils are very inefficient in this respect. The compression in both cylinders should be equal—this is important. You might try reversing the ignition connections, changing position of plugs, and remember that the two inlet valve springs must be of the same tension. If you reverse the two and the misfiring is transferred to the other cylinder, you will know at once the cause of the trouble.

Books for . . . Motor Cyclists

Motor Cycles & How to Manage Them.

Price 1/2, post free. 12th edition.

Entirely rewritten and brought right up to date. Useful alike to expert and novice. The whole of the information given is applicable to any of the leading makes of motor cycles on the market.

Hints & Tips for Motorcyclists.

Price 1/2, post free.

Reprinted from *The Motor Cycle*, and will be issued in book form for the first time at the Stanley Show. Orders for the first edition should be placed at once.

"The Autocar" Folding Map of England and Wales.

Price 8/10, post free.

A real necessity when on tour. It is well printed on linen, and folds up into a neat and strong case, 7½ × 9½ in. An indispensable motor cyclist's companion.

A full list sent on receipt of postcard.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

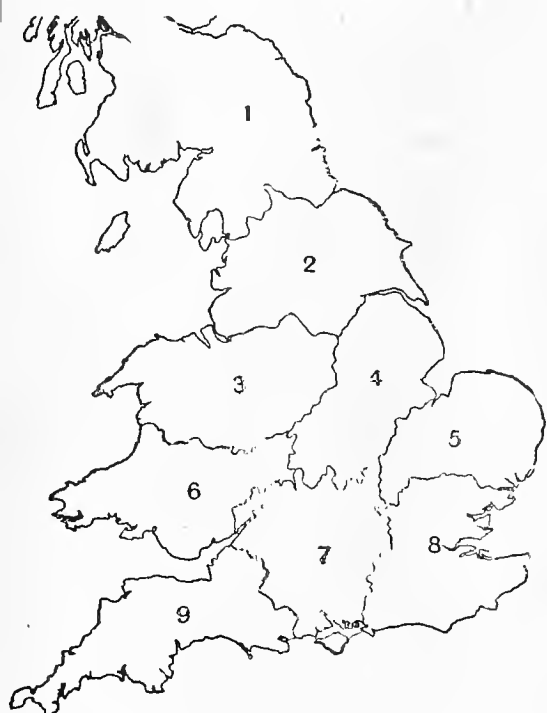

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London (20, Tudor Street, E.C.), by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

PREMIER BARGAINS.

WRITE FOR LISTS.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.
Telephone 4310. Telegrams: "Primus, B'ham"

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

TWIN-CYLINDER Werner, perfect condition; must sell; no time to ride: £14, or nearest offer.—Redman, Green Royd, Arnsdale.

3 h.p. Humber, in good running condition, two new covers, new accumulators, new horn: £10.—Messrs. Braithwaite and Sons, Staveley, Kendal.

TRIUMPH, 3 h.p., magneto, splendid condition, spare tube, tools, etc.: £25.—Full particulars, Young, 18, North Terrace, West Allotment, Newcastle-on-Tyne.

SECTION II.

York and Lancashire.

2 h.p. Triumph, Minerva engine; £12.—Peacock, Rake Lane, Liscard.

3½ h.p. 25 Guinea Rex, 1907, as new, unused; what offers?—1, Bank Terrace, Whitworth.

TRIUMPH 1907, magneto, splendid condition, 3½ h.p.; £28.—Kenworthy and Co., Bailiffe Bridge.

1908 Triumph, new condition, complete with headlight, horn; £36.—Cross, jeweller, Rotherham.

2½ h.p. Humber, stand, lamp, spares, £6 10s.; 5½ h.p. Humber engine, best offer.—Bebington, Widnes.

VINDEC Special, 5 h.p., magneto, Trufault forks, very fast, good condition; 20 guineas.—58, Manchester Road, Hyde.

1907 3½ h.p. Triumph, new 1908, almost new, £32; 1907 3½ h.p. N.S.U. (accumulator), beautiful condition, £17.—3, Fleet Street, Preston.

5 h.p. Twin Magneto Roc, two speeds, spring forks, new Palmer cord tyres; £25; smaller machine part exchange.—7, Blair Grove, Southport.

3½ h.p. Rex, 1905, variable, four speeds, operated from saddle, handle starting, low built; £16, or exchange twin.—Hayes, Grocer, Clayton, Manchester.

VINDEC Special, 5 h.p., with Roc two-speed and free engine, handle starting, a splendid machine for sidecar work, everything perfect; £36.—Tomlinson, Peany Street, Lancaster.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

MOTOR BICYCLES FOR SALE.

HAMPSTEAD for reliable machines.—2½ h.p. Kerry, good condition, new back tyre, 1 accessories, spring forks; £8.

HAMPSTEAD.—1908 Lightweight N.S.U., magneto, only shop-soiled; £18, with 1 accessories.

HAMPSTEAD.—3½ h.p. N.S.U., late model, magneto, 24in. wheels, new condition, guaranteed perfect; only £17.

HAMPSTEAD.—3½ h.p. 1908 Triumph, handle-bar control, new condition; £37, with all accessories.

HAMPSTEAD.—1½ h.p. F.N., 1908 model, new condition; £17, with all accessories; great bargain.

HAMPSTEAD for new machines, F.N.'s, 5-6 h.p., late models from stock; exchanges entertained.

HAMPSTEAD.—5 h.p. Twin Peugeot, Chatter-Lea No. 6 frame, splendid condition, like new; £20.

HAMPSTEAD.—New Griffons at second-hand price; £4 under catalogue price, only shop-soiled.

HAMPSTEAD.—3 h.p. Fafnir, good condition, low, with all spares; £10, guaranteed.

HAMPSTEAD.—4½ h.p. four-cylinder F.N., 1908, magneto, and spring forks, two months old, complete with all accessories; £9.

HAMPSTEAD.—F.N., 4½ h.p., four-cylinder, 1908 model, magneto and spring forks, 1 accessories; £28.

HAMPSTEAD.—Sole agents for Griffons, Triumphs, Vindes, Minervas, F.N.'s, S.U., Browns, Rexes, and Rocs. We allow 10 upwards for your old machines, any condition, in part payment for new models, any make. Write, call, or telephone, 2678, O.—Motor Works, 5, Heath Street, Hampstead.

OC, 1908, two-speed; cost 48 guineas; good condition; must sell: £28 10s.—S., 110, High Street, Merton, S.W.

DEUGEOT, 2½ h.p., Chatter-Lea frame, recently re-bushed, tyres good; £8.—170, Purple Road, Wimbledon.

TOTOR Cycle, 3½ h.p. Rex, in thorough good order; £10, or offer.—Hancocks, High Street, Battersea, S.W.

1 h.p. Rex, new belt and accumulator; £13, or exchange.—Crocker, 37, Hutton Road, Lambeth, London, S.E.

h.p. Quadrant, spring forks, new belt, and two new accumulators; £11 10s.—Boomfield Brothers, Braintree.

h.p. N.S.U., magneto, splendid condition, Continentals, Brooks B100; £17.—54, Wellington Road, St. John's Wood

1 h.p. Jap, Chatter-Lea, 2½ Dunlops, long, low, reliable, little used; £25.—Williams, 118, High Street, Beckenham.

1 h.p. Alldays Lightweight, excellent condition; 9 guineas, part exchange.—Warwick, Leadenhall Buildings, E.C.

BAT, 2½ h.p. De Dion engine and carburettor, Whittle belt, new tyres, fast machine; £15.—50, Manor Road, Brockley.

QUADRANT, 3 h.p., surface, Watawata; sacrifice £7.—Chatter-Lea, The Cottage, Bourne Lodge, Queen's Walk, Ealing.

1908 7-8 h.p. Ardennes Minerva, very little used, with accessories; £38, or nearest offer.—73, Pearson Street, Kingsland Road.

VERNER, 1908, 4½ h.p., twin, divided cylinders, spring forks, almost new, scratched; great bargain, £16 16s.—Below.

N., 1908, 3½ h.p., magneto, spring forks, like new; cheap, £18 10s. cash.—Below.

OVER, 1906, 3½ h.p., M.O.V., new tyres, dead snip; £11 15s.—Whittle, 41, Skellock Street, Wandsworth.

1908 3½ h.p. Minerva throughout, as new, done 500 miles, spring forks; £21, bar, in.—46, Turnham Green Terrace, Chiswick.

h.p. Werner, very powerful, Clincher tyres, hardly scratched; £9 15s.; perfect condition.—198, High Road, Wood Green.

1 h.p. Motor Cycle, running order; best cash offer, or push bike and cash.—7, Aldborough Road, Seven Kings, Ilford.

WE WISH TO

Clear out some of our stock for 1909 models, so can consider any reasonable cash offer.

REMEMBER now is the best time of the year to buy a GOOD, cheap, motor cycle, as we must lower our stock.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

The Number of Motor Cycles.

IMPORTANT evidence of the very marked increase in the number of motor cycles in use has come to our knowledge through a source which can be fully relied upon. Everyone is aware that high tension magneto ignition has been practically universal on 1908 motor cycles, and that the great majority of these magneto machines have been supplied by the Bosch Magneto Co., London, or the works at Stuttgart. It occurred to us that a firm manufacturing such a large quantity of magneto machines, which are almost universally used on motor cycles, would be in a position to inform us of the number sent out from their works during twelve months. We therefore communicated with the company, and were informed that, although no separate records were kept of the number of magneto machines sent to different countries, the total number was at our disposal. We decided that a very fair estimate could be obtained of the number of magnetos used in this country fitted either to British or Continental built motor cycles, including those re-exported to our colonies. The figures with which we have been supplied fully confirm the opinion we had formed, that the increase in the number of motor cycles during the past twelve months has been very considerable. To the figures provided by the Bosch Co. must be added an estimated number of motor cycles sold with battery ignition, also an estimated number of motor cycles fitted with the various other makes of magneto machines. It is difficult to estimate these additions at all accurately, but presuming that the total number of battery ignited and other

magneto ignited motor cycles is 50% of the figures given by the Bosch Co., we have a total of over 20,000. The total number of motor cycle magneto machines sent out from the works of the Bosch Magneto Co., Ltd., from July 1st, 1907, to June 30th, 1908, was 13,756. Of these 9,553 were for one cylinder and 4,203 for two and four-cylinder motor cycles respectively. At a low estimate, we should say that 60% of these magnetos have reached England, either for fitting to British made motor cycles, or as part of the equipment of imported Continental machines. If 60% of the total of other magneto ignited and battery ignited motor cycles are added to those figures we have a total of about 12,379, which, notwithstanding the period of depression in trade which we have gone through during the time mentioned, shows a distinct increase in the popularity of motor cycles. It is, of course, impossible to obtain the exact number of motor cycles turned out by the different home and Continental manufacturers and assemblers, but a rough estimate we had previously prepared from information obtained fully confirms the figures sent to us by the Bosch Magneto Co. with regard to the increase in the number of machines sold. It will be noticed that the figures given us are from July, 1907, to June, 1908, so that it is practically certain that the machines they represent do not remain in stock. Even if a proportion are unsold they only represent a similar stock which existed previously, and which one might call the floating stock—a figure which does not affect the estimate. The increase for a similar period of 1906 and 1907 according to the registration figures we published on July 31st, 1907, was 8,142.

By E. DOUGLAS FAWCETT,

Author of "The Riddle," "Hartmann the Anarchist," "Swallowed by an Earthquake," "The Secret of the Desert," etc., etc.

A GLORIOUS November afternoon, with the sunshine flooding the chalet, on the balcony of which I take lunch. The motorist's season in the Alps is drawing to a close. The snows of approaching winter are stealing down the great mountains across the valley; the garden looks desolate, and its paths are strewn with dead leaves; there are brown patches on the once green slopes around me; the music of the cowbells is no longer heard, the cattle being shut up in their winter quarters, whence they will not emerge till the spring. It seems about time to house the Bat up here for the winter, but a satisfactory run is, of course, to be enjoyed first. I descend from our eyrie to the pathway beside the torrent, and thence to the Bat's quarters in an outhouse some three hundred feet below the chalet. There are no adjustments to be made, and I am soon spinning along the rough road which leads from Chateau d'Oex in the "High Country" of the Canton de Vaud to Rougemont.

Speeding along amid Magnificent Scenery.

Stretches of newly laid stones make travelling unpleasant at first, but once clear of the village I give the 6 h.p. twin its head, and speed along merrily amid superb scenery. To the left are the long chalet-set slopes of the mountain on which I live; to the

right stretches the valley of the Pierreuse, bounded by lofty and rugged peaks. The Sarine winds far below in its pine-set sinuous gorge. The road is unlike those for which the mountainous parts of France are famous; its windings compel caution; it is narrow and badly surfaced. Happily, there are few carts about, and a good pace (somewhat above the Swiss legal limit) is maintained. Soon Rougemont is reached, and with it the Bernese Oberland, where German begins to replace the French spoken in the canton of Vaud. Further on, topping a mound above the road, are the ruins of a fastness once owned by robber barons of ill repute; the pines are now growing in the floor of the ruined hall. On my right tower the peaks of the Rublihorn, 7,500 or so feet in height, and a barrier of dark-wooded mountains walls in the valley on the left. Some miles forward, and Saanen, the capital of the upper valley, is reached. The industry of this high valley centres round cattle and the wood trade. There is little else of importance to keep things going, though, doubtless, the disbursements of the summer and winter tourists prove of use.

At this point I have now a choice of roads. On the one hand, I can go to the right, and, passing Gstaag (Gsteig), and crossing the Col de Pillon (a grand run, reaching 5,000 feet), descend steeply to lovely

View from the balcony of the chalet. The quarters of the Bat can just be seen at the bottom of the illustration.

An early winter scene from the author's chalet, Chateau d'Oex (Gummluh range).

The Last Run of the Season.—

Ormont-dessus; or, on the other hand, I can cross the Col of Saanen and descend into the valley of the Simme, which leads past Zweisimmen towards the lower country beside the Lake of Thun.

Ascending the Col of Saanen.

I take the latter route, and put the twin at the climb without ado. This "col" is an easy one, as the turns are not severe, and one can let the machine go in a way impracticable on curving ascents. I have only one corner to negotiate with reasonable prudence, and the twin is playing with the gradient in a manner that augurs well. The corner past, a long stretch of straight going meets the eye. I open the throttle, and am borne up the hill at a rush, startling some road-menders and leaving a long trail of dust in my wake. A kick frees the silencer, and the warning bark of the engine heralds my coming to all interested ahead. At the top (4,200 feet) I dismount to enjoy the view. There is a fine view down the sunlit green valley. The Rublihorn, Gummfluh (8,060 feet), and the other great peaks past which I have come show grandly in the distance, while towards Gsteig, whither the just-left Sarine Valley winds, there is a vista of far snow-fields and glaciers. I recall a pleasant summer crossing—on foot, of course—of the Sanetsch from Gsteig to Sion in the Rhone Valley last August. Delay would be pleasant; however, the breeze up here is somewhat keen, so, mounting once more, I cross the last portion of the "col," and descend to Zweisimmen. This latter place is of no special interest, but the run thither is through remarkably lovely scenery. Two wooden bridges (covered as a protection against the winter snows) over torrents are passed.

An Ever-changing Picture.

The pine-clad mountains, backed by snow-crested distant peaks, furnish an ever-changing picture. One is forced to slow the going, for a descent of this superb-kind at any speed is ridiculous, even if it were not a crime to rush down such a wonderland. Anon I meet cattle whose antics compel two dismounts. Zweisimmen itself I find in the throes of a cattle fair, and note signs that the function is breaking up. Not desiring to thread a road blocked with drovers and their charges, I spend a bare five minutes in the village, and am soon well on my return journey up the "col." The ascent, which does not tax the twin seriously, is delightful to a degree, contrasting favourably with a former crawl up the same place in a slow car. I get past the unruly cattle with the help of the clutch, avoiding a dismount, and, topping the pass, float swiftly down

to Saanen, and thence along the beautiful valley home. But now comes a novel experience. The bicycle has to be got up to the chalet, where it is to be housed for the winter. I pass its old quarters, turning out of the high road into a path that leads up the mountain. All available power will be needed, so with cut-out kicked open I flit up the steep, bumpy track, on which, it is safe to say, motor cycle has never sped before. The clutch is twice taken out to let the engine race, and is then let in smartly with excellent effect. An old peasant woman with basket on her back leaps aside in dismay. I am rising fast, when, behold, at a bad turn, cautiously approached, I find progress blocked; a wood cart, with front sleigh runners of the mountain sort, stops the way.

Help from a Horse.

I have to dismount, and, finding anon that further advance is impracticable, owing to stones and steepness of gradient alike, cooee loudly to the chalet, which is still far above where I am. My landlord, with horse and mountain "charrette" (having front runners), descends the slope to my left, and, fastening the bicycle to the charrette, and leaving me to steer

it on foot, gets his very efficient hay motor going. A strange procession struggles up the steep grass slope and halts beside the chalet. There will be no release of the bicycle from its prison until March, but I am closing the season without regrets, winter sports, which include two or three months of skating, being shortly due. I am sorry that the quaint spectacle of the final climb was not "snapped." The innovation was really worth recording!

Where even the twin won't go!

Motoring in the high Alps is of enthralling interest, and the enthusiastic motor cyclist gets more fun, in my experience, than the man on a car. I must reiterate my advice to all and sundry to taste of its pleasures for themselves. It is encouraging to see that some of my readers have taken this advice to heart. But if the best sport is wanted they must not rest content with minor ascents like the Fauçille, Col de Megève, or Col des Mosses. They should steer their wheels over all the high places which I described in these columns last year. Further, a run up the Stelvio (9,100 feet) would also be tempting, but, unfortunately, access to it *via* Switzerland is not yet allowed.

The Overheating Question.

Perhaps a few remarks on hill-climbing may be in place. I am no engineer, but a practical rider with considerable experience of mountaineering on wheels. My opinion is that the best of twins must sometimes overheat and lose efficiency on the very long climbs. I

The Last Run of the Season.—

mean by a long climb anything from three to twenty miles in length. I have never on any occasion found a motor cycle engine, however hard driven and however close was the weather, overheat on the level. But on four or five occasions I have had stops due to overheating during the ascent of passes. And on

Bringing hay down from the mountains to the chalet.

some other occasions considerable skill was required to effect non-stop ascents. The trouble encountered was due to two causes—(1) the numerous turns which the more difficult climbs present and (2) specially hot weather.

Regarding No. 1, I could cite many stiff passes, *e.g.*, Mont Genève (on the French side), where the gradient—1 in 9 or 10, as it may be—is not the source of worry at all. The 6 h.p. Jap would hardly shy at miles of this sort of thing, were it not for the turns. These latter are often of the hairpin kind, and must be taken more or less slowly, and the ensuing “pick-up,” with temporary overloading, tends to heat the cylinders apace. I topped the Col of Mont Genève (6,080 feet) in sweltering heat, but had to take the corners as quickly as the position of the footrests permitted. I note that a writer in *The Motor Cycle* found the turns troublesome in climbing the less formidable Col des Mosses (4,700 feet)—a very familiar jaunt of mine near here—but his Vindoc possessed the advantage of a seemingly most excellent two-speed gear.

Regarding No. 2, I attach great importance to this factor of the weather. Thus in climbing the Col des Mosses on a very hot August day I was brought to a stop for five minutes unquestionably by loss of power due to very hot cylinders, the oil, I take it, burning off the cylinder walls and reduced charges of mixture entering the combustion chambers. The heat was very marked, especially in the back cylinder. Later, on a cold autumn day, riding an unaltered machine and using the same lubricant (“Very Thick” *Huile Vitesse*), I was able to play with the climb, despite the soft, mushy condition of the road in the upper portion of the pass. The contrast with the foregoing run was surprising indeed, an ample reserve of power and splendid picking up qualities being shown throughout. A test of this kind, which involves miles of climbing (slowing being necessary for stiff turns and when meeting carts, etc.), speaks for itself. Let me add here that the Jap engine and Bat bicycle have acquitted

themselves most excellently, in view of my continual “getting upstairs.” I have seldom taken out the machine without indulging in a fairly serious climb.

General Advice to Tourists.

Lubricants are very important. I am very satisfied with both Huile Vitesse (very thick) and De Dion-Bouton oil. In touring, always carry a spare oil tin. Petrol is always to be had in France and Switzerland in any place which is not a mere hamlet, but good oil is often very difficult to obtain.

A clutch is useful on the long passes, on some of which restarting after a stop would be impracticable without its aid. But a two-speed gear is, of course, better still. I should not dream of purchasing another touring mount for use in the Alps unless it comprised such a gear. My fix last year on the one in six corkscrew turns of the Galibier is still vividly present to memory. And there remain some formidable freak climbs which I have not attempted, for the simple reason that no single-gear twin (with an adjustable pulley yielding, say, a 5 to 1 or 5½ to 1 gear at need) could possibly be expected to tackle them. It must be admitted, however, that these climbs are all on byroads or rough tracks, and that the twin has never failed on any of the main roads which traverse the Alps. A wonderful contrivance is the twin motor cycle, even in its present form!

Two final hints. A good leather belt (I use a chrome leather Demange) is very much to be preferred to a rubber one for climbing. I have done with rubber belts for use in the Alps.

Near the top of the Col de la Faucille (on the way up from Gex and Lake Lemman).

Heavy boots, nailed as if for mountaineering, make very effective reserve brakes. They would, however, hardly suit machines which retain pedals, if the usual guides' nails are adopted. The best motor cycle brake I ever saw is the N.S.U. wooden shoe, which is forced into the groove of the belt rim. The popular fibre-lined band brake is a makeshift quite unsuitable for Alpine work. It failed me both on Mont Cenis and the Galibier.

Powell's Two-speed Hub Gear.

THE above title is that of the redesigned Fitall hub gear, which was shown at the Stanley Show last year. Belt or chain drive may be used. Two models are made—one for passenger work, and a light type for engines up to $3\frac{1}{2}$ h.p. In the

Sectional view of Powell's Two-speed Geared Hub.

smaller size the gear reductions are 55% and 33%, but in the larger models only 33%.

On a fixed motor cycle rear wheel axle A in ordinary fork ends a sleeve S revolves on ball bearings, which carries driving belt spokes to the rim B and the usual free-wheel clutch F. On this sleeve is keyed a pinion P, which is also a cone for the ball race, corresponding to ball race cone. D. The hub shell, with tyre rim spokes, revolves on the two bearings O_1 and O. In the hub shell H is fixed a pinion D forming the cap of the ball bearing O. G is the gear box, and this turns round sleeve S, and contains three planetary pinions, of which two are shown at P P'. These pinions are in continual mesh with pinion P on sleeve and pinion D, which is a part of the hub shell. C C₂ is a leather faced clutch mounted on a squared portion of the pinion P. M and M are cams for operating the leather faced clutch by rods or otherwise, and B B is a band brake round the drum of the gear box.

To start the engine the levers are placed in the neutral position; the pedalling gear is then revolved, which turns sleeve S, belt rim, and engine pulley

without rotating the road wheel. The rider then seats himself, and with his foot presses the low speed lever, which tightens band brake B B and holds gear box stationary. The mechanical conditions are then as follows: Engine drives sleeve S and pinion P, which in turn rotate the three pinions P P', and thus the motion is communicated to the hub shell (and bicycle wheel) through pinion D. In climbing hills, if further reduction is required the clutch may be slipped. The gear box S being capable of rotating idly, as soon as brake band is released the free engine position is obtained. From this free engine position the change to top gear is effected by bringing the external member of leather faced clutch C into contact with the internal member C₂ by means of cam M operated by rod (shown in the second diagram), which is connected with a handle on the top tube. Thus the gear box and hub shell revolve solidly with sleeve S turned by the belt rim.

For starting no handle is required; pedals only are used, and, being always at hand, the engine can be started in traffic without dismounting. If the rider prefers to start the engine by using the clutch, the reverse shock will not damage the gear.

The gear and its operating mechanism fitted to a motor cycle. The engine is started by the pedal, the low gear engaged by pushing forward the pedal on the footrest, and the high gear by pulling the lever on the tank towards the rider.

A. D. Powell and Co., 3, Aylestone Street, Leicester, who fit the gear complete with back wheel excepting tyre, say it is necessary that the back forks of ordinary motor cycles should be set out or so altered as to take the longer axle of this gear.

A SUNDRIES STOCKING SCHEME.

HITHERTO motor cyclists have been greatly inconvenienced through their inability to quickly obtain sundries and replacements for their machines. Especially when touring does the inadequate arrangements for supplying sundries become apparent. There are exceptions, but very few agents take the trouble to stock any parts at all so as to meet the call which is made upon them.

For 1909 the Rex Motor Mfg. Co., Coventry, have determined that, so far as they are concerned, every possible facility shall be given to the public for obtaining immediate delivery of any part which may be required for either 1906, 1907, 1908, or 1909 Rex models. The Rex scheme is a simple one. The

company have arranged with their leading agents to always have in stock a complete assortment of accessories and sundries. So far twenty sundries stocking agencies have been arranged, and the company wish to urge upon the public the advisability in future of passing their sundry and repair business through the local centre, as by this means they will save delay and cost of carriage.

The cities and towns in which the above arrangement has been completed are as follow:

Birmingham	Dorchester	Kendal	Manchester
Bradford	Dublin	Leeds	Newcastle-on-Tyne
Cardiff	Edinburgh	Leicester	Preston
Chester	Glasgow	Liverpool	Swindon
Doncaster	Hull	London (2)	Weymouth

SHADOWS BEFORE.

SOME IMPROBABILITIES.

HALFWAY up a half-mile rise of respectable gradient the engine stopped for want of petrol, and I was stranded. Still, a fairly frequented road in the middle of an August afternoon is not a hopeless proposition for the begging of the needful, so it was with great resignation that I arranged myself in comfort on the bank at the roadside to await succour. I must have been sprawling there in a sleepy condition for half an hour or more when I was roused by a peculiar sound—a tiny vibrating hum such as might be expected to issue from a liliputian threshing machine when heard at a great distance. Guided by its apparent direction I looked down the hill, and there quite close was a motor cyclist speeding towards me, the engine giving out this strange note.

Spotting me couchant in my lair, he stopped.

"Anything wrong?" he asked.

"Juice all gone," I replied.

"That's soon put right, if you've got anything to pour some into."

I had a pocket tumbler which answered the purpose admirably, and while the transfusion was proceeding I inspected my deliverer's machine.

Nothing quainter was ever seen than that mount of his. The engine and its "outbuildings" were all hung round the saddle tube, just above where the bottom bracket is situated on most machines. It was for all the world as if the vitals of a lightweight had been torn out and lashed haphazard to a pedal bike.

[Cylinder as Big as a Breakfast Cup.]

The engine was upright in position; but such an engine! A cylinder about as big as a breakfast-cup, and as innocent of radiating ribs. I could see no sparking plug at all, which seemed a fatal obstacle in the way of satisfactory service. There was a copper crank case on the same wee scale as the cylinder, and on one side of this was the outline of a chain case—quite small—continuing to the rear wheel, the gear ratio being apparently about two to one. The opposite side of the crank case was occupied by a drum-like extension which, in a hazy sort of way, I decided must contain the ignition and valve gear—if there were any. A solitary tank was attached to the side of the seat tube away from the engine, and I tried to trace out the pipe arrangement in the hope of its leading me to daylight. One pipe extended upwards from the cylinder for about three inches, and there ended in a queerly shaped copper box of small size, which, from the fact that it was furnished with a row of holes and had evidently been pretty hot at times, I took to be the silencer. The only other pipe from the cylinder turned sharp at right angles just above, and disappeared into a small brass cylinder decorated with a couple of screw plugs and a tap, and joined to the fuel tank with a graceful festoon of fine tubing. "The carburetter," thought I, and was thankful for even so little as this that accorded with my notions of a motor.

"That's about as much as I can spare," my benefactor now remarked. "I daresay it will take you to where you can get some more."

He seemed a friendly sort of individual, and I prepared the way to an indaba by proffering a Molachrino.

"That is quite an unusual little jigger of yours," I said. "Do you mind giving me a few details?"

He politely intimated he would be delighted.

"To begin with, the engine is rather a high-speed one—about 4,000 revs."

"4,000!" I echoed, amazed.

"Yes; fairly fast, is it not?" He seemed to find it a matter for gratification. "Of course," he went on, "speeds have been rising the last few years, but this is about as far as we have got for ordinary work."

"Gear looks high," I suggested.

"Well, you can hardly tell from outside," he replied. "You see, the crankshaft carries a gear wheel meshing with an internally-toothed ring which carries the band on its outside."

"And you run your belt in oil?" I ventured to remark, in a burst of sarcasm.

"Of course," came the unperturbed reply; "these steel belts drive much sweeter that way."

"Steel belts!" I was just able to stammer in my bewilderment.

"Yes; like a measuring tape, you know—it was a German idea, I think."

At this point I reflected rapidly. Now, I thought, I have you. No radiating ribs and a speed like that. I said, "What about cooling at such very high speeds?"

His glance struck me as indicating mystification. "You can't cool salamandarite, you know, because—well, because you can't heat it to start with," said he.

"Sala—sala—Excuse me. Sala—how much?"

"Salamandarite," he answered, rather impatiently. "The special cylinder material that can't be heated and doesn't conduct heat. The burning charges don't heat the cylinder, and therefore the cylinder can't heat the fresh gas."

He seemed inclined to enlarge at this point, so I contented myself with murmuring, "Just so; I see."

"The effect is," he continued, "that the heat of each explosion is retained in the cylinder until the exhaust valve opens, when it vanishes and leaves the walls perfectly cold. It's a fine thing; there was quite a fuss when it was first brought out."

I did not remember either the fuss or the bringing out, but contradiction seemed hopeless. Besides, I was boiling over with curiosity.

"The engine looks small," was my next venture, remembering his healthy pace up the hill.

"Oh, about ordinary," he replied. "These engines don't have to be as big as the old Otto cycle ones."

This was getting decidedly too hot. "Old Otto cycle," I repeated menacingly, feeling ready to uphold the sacred principle with my life.

But he was busy with an adjustment in the region of the carburetter, and did not appear to have heard me.

"Is this one of those two-cycle contraptions then?" I enquired, compressing as much disdain as possible into my tone.

"Not the ancient Day dodge, if that's what you mean," he reassured me. "The gas is drawn into the crank case and then forced into this container." (Indicating the brass cylinder which I had mentally accused

Shadows Before.—

of being the carburetter.) "As the piston moves downwards the gas follows it from the container until enough is in the cylinder, when it is fired by an incandescent wire heated with current obtained from a low-tension magneto generator."

I felt argumentative. "Seems wasteful to lose half of each stroke," I complained.

"Not more so than the antique method of losing the whole of every other one," was the pulverising retort.

"Aren't the impulses awfully weak?" (I was losing heart.)

"Can't be so very, to get five-horse out of that," indicating his ridiculous-looking engine. "You've got to remember there's no compression to provide for, and no heat being lost by radiation the full expansion of each charge is available to the end of the stroke."

"What about carburation?" said I, becoming conscious of a sick longing to know the worst.

"The air is carburetted as it enters the container."

Foiled here, I mentioned the matter of lubrication.

"The air is sprayed with oil as it enters the crank case," he glibly countered.

I saw a ray of light. "Doesn't the oil burn when it enters the cylinder?"

I could swear there was triumph in his voice as he replied, "Not at all. The mixture is given a rotary movement as it enters the cylinder, and centrifugal action throws the heavier particles of lubricating oil on to the walls."

Up to this point I had been standing. Here I sat down. I thought it safer. My brain was in a whirl. Feebly I muttered to myself, "The year 1908 and the Lenoir cycle redivivus." My friend must have heard me, for he said, "1908. Oh, no. It has only been adopted during the last two years."

Before I had time to seek light on this cryptic utterance he added, "I can't imagine why the makers fitted such an infernally noisy magneto; it's the most diabolical orchestra you ever heard."

"Er—noisy magneto?" I felt I must have misunderstood him.

"Yes; hums like an aeroplane, due to molecular movement in the armature caused by changes of polarity."

I stared open-mouthed. Staring seemed all that was left for me to do. I should be staring now, but suddenly the unmelodious tooting of a horn fell on my ears, and then—

Well, then I awoke.

J. B.

A FIFTY MILES ROAD RACE IN AUSTRALIA.

THE Victoria Motor Cycle Club held a fifty miles road race at Campbellfield, near Melbourne, on September 12th. The course was to a point twelve and a half miles out and back, and was covered twice. The contest proved exciting. Out

C. S. Cox, who rode a Peugeot in a 50 miles Australian road race.

of twenty-three entries, twenty-one riders competed, as follows: G. Overgaard (2¼ h.p. Hogan), 2m. 45s. start; W. H. Cuddon (2¾ h.p. Peugeot), 2m. 49s.; C. Cook (3½ h.p. Triumph), 3m.; A. Millidge (3½ h.p. Triumph), 3m.; J. Miller (3½ h.p. Triumph), 3m. 1s.; J. Biddlecombe (3½ h.p.

Triumph), 3m. 1s.; C. Cox (3½ h.p. Peugeot), 3m. 2s.; J. R. M'Kenzie (3½ h.p. Peugeot), 3m. 2s.; H. Jenkins (3½ h.p. Triumph), 3m. 2s.; D. Fraser (3½ h.p. Peugeot), 3m. 3s.; F. Ortner (3½ h.p. Triumph), 3m. 3s.; L. Benn (3½ h.p. Triumph), 3m. 4s.; W. Stevens (3½ h.p. Triumph), 3m. 4s.; N. Jackson (3½ h.p. Peugeot), 3m. 4s.; L. Fallon (4 h.p. Brown-Jap), 3m. 6s.; R. Heath (5 h.p. Peugeot), 3m. 8s.; H. Perry (5 h.p. Peugeot), 3m. 9s.; E. W. Brown (5 h.p. Peugeot), 3m. 9s.; L. Kidgell (5 h.p. Peugeot), 3m. 10s.; W. J. Dwyer (5 h.p. Peugeot), 3m. 10s.; and H. F. Hall (5 h.p. Peugeot), 3m. 11s.

A strong north wind was blowing, and the road was dusty. At the end of the first twenty-five miles the leading fifteen were riding in the following order: Cuddon, Miller, Ortner, Cox, Overgaard, Cook, M'Kenzie, Heath, Jackson, Jenkins, Hall, Perry, Dwyer, Brown, and Biddlecombe. As the riders went over the course for the last round, a gale was blowing strongly, and in places the dust proved somewhat dangerous. The leaders dashed by the winning post for the last time in the following order: Cox time, 1h. 20m. 50s.), 1; Miller (time, 1h. 21m. 15s.), 2; Hall (time, 1h. 13m.), 3. Then came, in the order mentioned, H. Fraser, Biddlecombe, M'Kenzie, Ortner, and Jackson. Hall's time averages a little better than forty miles an hour, which, considering the wind that blew, was a creditable performance.

It has been pointed out to us that Mr. B. H. Davies, the contributor of a recent interesting article, "Which is the Best Sidecar?" had nothing to say about two-wheeled sidecars, such as the Lowen, which has been on exhibition at the last two or three Stanley Shows. Perhaps some reader with considerable riding experience of this particular model will kindly supply the obvious deficiency.

LETTERS TO THE EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Lightweight Experiences.

[3651.]—Many motor cyclists appear interested in lightweights. The chief objection would appear to be due to slipping belts. Yet a round belt and jockey pulley have many advantages. Can no one suggest a method by which a round belt could be prevented from undue slipping, say, by having wire coiled around it, to engage with grooves in the flanges of the pulley?

I would suggest that lightweights would be better with an open frame; not only could they be ridden by a lady, but they would be easier to mount and dismount, minimise the effects of side-slip, and allow one to wear a longer coat.

Let us hope the Stanley Show will give us a greater choice in really light machines.

CONVERTED.

[3652.]—I should like to add my testimony to the efficiency of the Moto-Rêve. I consider it an excellent machine for a medical man—quiet, and clean to ride. It starts easily, although when I first had my machine I had much difficulty in this respect, and in the end I sent the machine back to London, and the company put in a new engine rather than keep me waiting while they found out the cause.

Since then I have had no difficulty. I have ridden in all kinds of weather, and have had no mechanical breakdowns. I also have no interest in the sale of the machine beyond the fact that I believe it will supply a long-felt want to those medical men who shrink from the troubles and trials of a heavyweight.

LEONARD MINTER, M.D.

The Handicapping of Motor Cycle Races.

[3653.]—With reference to the letter from Mr. W. W. Genn *re* the handicapping at Brooklands, while I must admit he puts his case very well, his proposed remedy (handicapping on engine capacity alone) would not improve matters. I would like to remind Mr. Genn that when he was delighting *habitués* of Canning Town track with skilful exhibitions of motor cycle riding he was in receipt of ten and even fifteen seconds start from a rider using an engine of the same bore and stroke, viz., 76 mm. x 76 mm., and even then his name did not figure in the winning list except on very rare occasions. I should also like to point out to him that the 5 h.p. he speaks of at the Stadium was a 3½ h.p., and was about double the weight of his machine (a converted racer), and was driven by a man 3 stones heavier than himself.

"FIVE" HORSE-POWER.

Unsuitable Accessories.

[3654.]—In *The Motor Cycle* of September 9th I find a correspondent has written regarding accessories supplied by firms from whom the motor bicycle is purchased and their consequent misfit. I will give you my experience.

I ordered a motor bicycle from the London agents of a well-known firm, and whilst the bicycle was on the way out to India I wrote them quoting them the machine, etc. (as they had shipped it direct from their stock), asking them to forward the following: One horn, one lamp and generator, three belt fasteners, and one inner tube. Of course, I expected them to know all details as to size, etc. When they arrived imagine my surprise when I found the horn would not fit anywhere, and has since been put on a motor car; it was sent with a long flexible tube and dashboard mountings. Lamp would not go on the bracket, and the generator clip holder had to be thrown away and another made to suit fork. Belt fasteners too small, and the inner tube 2½ in. instead of 2 in. Disgraceful is hardly the word.

India.

S. V.

Which is the Best Sidecar?

[3655.]—With reference to an article by Mr. B. H. Davies in your issue of October 21st, entitled "Which is the Best Sidecar?" I quite agree with him in claiming for the duplex steering sidecar the six advantages enumerated. He also says "that the correct adjustment takes some finding." Again I agree with him, but why, oh why did he not tell us how to do it? I have made a full size drawing of the steering gear, and have come to the conclusion that it cannot be done with the fittings supplied by the makers, because a long wheelbase requires an altogether different fitting from that of a short one. As many of your readers may have these sidecars still in use, I would be glad to furnish particulars of what is required to anyone who writes to me care of the Editor, sending a stamped addressed envelope, and stating length of wheelbase and width. L. JEFFORD.

Belts and their Fasteners.

[3656.]—Several letters have recently appeared in your paper regarding the vexatious manner in which fasteners of the ordinary pattern tear out of the ends of rubber belts. I have had a great deal of trouble in this way lately. On one occasion this occurred while I was running at a considerable speed, and the loose end of the belt whipped round the driving wheel mudguard, and dragged it down on the tyre, skidding the wheel, and abruptly arresting the machine. Had I been turning a corner at the time, a disastrous fall would have been inevitable.

The pulling out of the fasteners became worse when I had an Osborne four-speed pulley fitted to the bicycle, owing to the extra strain caused by the jockey-pulley and the change-speed mechanism. I wrote to Osborne Bros. for advice, and they recommended a patent fastener, made by Mr. Stanley T. Robson, 7, Blake Lane, Birmingham. The fastener has four small teeth projecting from a washer, which is prevented from turning and forms the nut into which the screw is fastened. These teeth grip the belt in such a way that it would probably break before the fastener tore out. At any rate, since using this fastener I have been freed from this exceedingly annoying source of delay.

M. EDEN PAUL, M.D.

Magneto Manufacture.

[3657.]—It is a matter of regret to myself and also to many other motor cyclists that of the few makes of magnetos placed before the public we can find none that are of British origin. How is this? Why is this branch of the motor industry so fearfully neglected by our countrymen? Is there some master patent which covers this principle of obtaining ignition? We think, sir, that you are the right person to give us poor cyclists a little light on the matter, and at the same time give the names of a few British designed and manufactured magnetos for motor cycles. It is strange that the much advertised magnetos are foreign made, and in some cases, or most cases, British firms are the agents; firms, in fact, whom we should expect to be leaders in manufacturing.

Again, may I ask you on behalf of myself and friends and a very large body of motor cyclists generally to kindly bring this matter forward.

J. JACKSON.

[There are two or three magneto machines for motor cycles manufactured in Great Britain, but none, so far as we are aware, are purely of British origin. It is often commented upon in motor circles that the largest British electrical firms are somewhat apathetic with regard to motor ignition generally.—Ed.]

Magnetising of Watches.

[3658.]—I should like to inform the writer of letter 3646 that he may save himself the trouble of getting a rubber bag for his watch. The only bag likely to be effective is one made of iron or steel. Rubber has not the slightest insulating properties as far as magnetism is concerned, as Mr. Hutchinson may prove for himself by inserting a strip of this material between a magnet and its keeper and testing the pull. By far the most likely explanation is that the watch was not magnetised at all.

J. O. THAIN.

A Valve Grinding Tip.

[3659.]—I herewith enclose a good tip for grinding inaccessible exhaust valves which you may or may not, as you think fit, publish in your invaluable paper. Also allow me to compliment you on your exceedingly useful book, "Motor Cycles and How to Manage Them," which I find most instructive. A good tip for grinding inaccessible exhaust valves is this. With your right hand take a screwdriver and press firmly on head of valve. With your left hand take another screwdriver or like instrument, and insert in slot in valve stem provided for cotter and turn backwards and forwards. It will be found that the task of valve grinding will be easier and quicker done than in the old way of turning with screwdriver, and the results are equally good.

H. HART-DAVIES

Lightweight Singles and Motor-assisted Tandems.

[3660.]—I was very much interested to read the letter of your correspondent (Mr. J. W. Chalfont) with reference to motor-assisted tandem bicycles. I have long thought of doing it, but have always been told that it would be a failure. I should be very much obliged if Mr. Chalfont would let me know a few particulars as to how he fixed the engine, and upon what part of the machine. I presume it was upon a lady back tandem.

CD 213.

[3661.]—I have read with great interest the experiences of various riders on lightweight motor cycles. But the letter [No. 3633] by J. W. Chalfont which appeared in *The Motor Cycle* dated the 28th October is, in my opinion, either sarcastic or requires confirmative evidence; presuming, of course, that "with perfect ease" means without pedal or other assistance, and that stops were not made to cool the engine.

The writer stated that riding a 1½ h.p. motor cycle he had "been carried across Dartmoor from Exeter via Moretonhampstead to Plymouth, taking all hills with perfect ease."

I have been over the road from Moretonhampstead to Plymouth (route 725 in the Contour Book) on my 5 h.p. twin Vindec, and if a 1½ h.p. motor cycle took a twelve stone rider up all the hills from Exeter to Plymouth by that route without assistance I should like to know how many stops were made to cool the engine, and how long the journey took? Was it blowing a gale behind him?

From Moretonhampstead the road rises nearly 1,000 feet in about six miles, is of a very winding character, and the surface when I was last there none too good.

Your correspondent's statement, reading it as I do, requires some substantiation, and I should be only too pleased, on behalf of other readers, to go over the same route with this gentleman at any time which can be conveniently arranged.

If the machine again does what is claimed, one at least enthusiastic heavyweight motor cyclist will have been converted to the lightweights.

CECIL R. J. ROBERTS.

A Problem to be Solved.

[3662.]—I note letter 3618 in the issue of the 21st ult., which introduces the interesting and important question why slightly lifting the exhaust valve often causes an acceleration of speed.

My own opinion, borne out by experience, is that, in the majority of cases, the cause is too much play between the valve stem and tappet rod, occasioning, consequently, insufficient exhaust clearance. It therefore follows that, the valve opening being further assisted by a slight touch of the lifter, better results take place, thus relieving the cylinder from undue choking or back pressure, which latter must, of course, retard the engine working properly.

I assume, of course, that the tappet itself is not worn and has the correct amount of lift. Finding that even ¼ in. of play between rod and valve stem affected considerably the

running of my engine, I fitted a new rod with an adjustable cap, screwed on and held in position by a lock-nut underneath, thus enabling a very fine adjustment to be made at any time minus the trouble of removing the cylinder for packing up or lengthening the rod.

This arrangement I think your correspondent "A Lever" will find to be the usual solution of the problem.

R. G. LINDSAY.

[3663.]—With reference to the letters which appeared in recent issues under the above title, might I venture to suggest my opinion as to the reason why the slight raising of the exhaust valve sometimes gives better running? I believe this to be due either to insufficient lift of exhaust valve or to the cam being slightly out of correct timing.

In proof of this I give an experience I had last summer. On my 3½ h.p. the roller which bears on the exhaust cam broke, and the valve was then raised by the pin on which the roller had been running, and the lift consequently greatly reduced. In addition, the valve closed before the top of

A Harborn electrically-driven tricycle of German origin, which was described on page 859 last week.

the exhaust stroke. I continued under these conditions for some time, making very poor progress, but presently I found that by slightly raising the exhaust lifter I ran almost twice as fast. This was solely due to the greater facility offered to the escape of the exhaust gases. Of course, this is an extreme case, but I think that those who have found the same phenomenon would do well to look to the timing and lift of the exhaust valve.

TS 211.

A Useful Machine for Hilly Country.

[3664.]—I have been a constant reader of *The Motor Cycle*, and in looking over several back numbers, and scanning a number of letters and articles on "Belt v. Chain," "Single v. Two or More Speed Gears," "Pedals or No Pedals," and other such controversies relating to the pastime of motor cycling, it occurred to me that my little experience may be of some use to those who are looking about for a mount for next year, or at least ought to be doing so if they desire to have in good time a machine specially built to suit their own ideas.

I am a pedal cyclist of over twenty years' experience, and took to motor cycling as the natural outcome of my love of the cycle. I started with a second-hand 3 h.p. belt-driven single-gear machine, and got a good deal of experience. Riding as I do in a hilly district, I found the single gear unsuitable. After careful study of the opinions of various riders appearing in *The Motor Cycle*, I resolved on the following machine: 3½ h.p. Quadrant engine, Phelon and Moore two-speed gear with chain drive (gears 5 and 9 to 1), Bosch magneto, Druid spring girder forks, 2in. Clincher extra-heavy tyres, and footboards, no pedals. The machine

was assembled by a local cycle builder, and has proved quite a success. The engine runs sweetly, and the machine starts off quite smoothly—no jerking either at the start or on the journey. The gear I have found most satisfactory. Of course I always run on the high gear, but I find the low gear most useful for starting, climbing stiff hills, going round nasty corners, and also in crowded traffic. For sidecar work the low gear is indispensable. I have had absolutely no trouble with the chain drive, and would not think of comparing it with belt drive for the same work. Both have their advantages, but for all-round work, including sidecar work, nothing can be better than the chain, at least in conjunction with this gear. I propose putting a much heavier tyre on the driving wheel, as I find the 2in. rather light. S. P.

Experiences with the Four-cylinder F.N.

[3665.]—Perhaps the following brief experiences may interest some of your readers.

Three months ago I purchased a 5-6 h.p. four-cylinder F.N., which I have since ridden some 1,200 miles purely as a pleasure mount in the short intervals at my disposal.

It is the first motor bicycle I have ever ridden, and my knowledge has been gained partly from your valuable paper and partly from direct experience.

I have never found the slightest trouble with the machine. Its ease of starting is remarkable; on the stand a quarter of a revolution of the pedals and it starts; on the road I run alongside, jump on by the pedals, and although I am comfortably seated, drop the valves and go away at once.

The longest non-stop run I have made is ninety miles, and I have done 100 miles on one gallon of petrol. I have also climbed, with ease Dashwood, Amersham, and Batchworth Hills, Sunrising Hill, the mile out of Great Missenden going towards Chesham, and the hill leading up from Tring, and, I believe, Wielding Tor, as well as the hill on the Hemel Hempstead Road out of Chesham.

Concerning fast speeds I say little, for I seldom attempt any, though, if required, I find the machine is capable of fast running. Of transmission troubles there are none, of vibration there is none, and the exhaust is silent.

I think, sir, that the above result from a machine in the hands of one quite inexperienced says much for its qualities, and enables me to ask a question which has long interested me, and which perhaps some of your readers may answer for me. What is the relative advantage of belt over gear transmission which causes all English makers to adhere to that form? I find no shock, and no excessive tyre wear, and, as I understand it, a vertical position of the cylinders is the best.

I have no interest whatever in this or any other make of motor cycle. M.D.

Handle Starting. A Useful Tip.

[3666.]—I have been very much interested in the discussion *re* above, especially with regard to the Roc clutch. One rider suggests placing the exhaust lifter somewhat nearer the starting handle, and I, being a short rider, quite agree with him. When starting it is just as much as I can manage to reach the handle and exhaust lifter at the same moment.

With regard to the type of Roc clutch fitted to the Rêx machines. In five cases this summer I have been able to put other users of this clutch on the way to get the best out of it. A friend purchased a mount fitted with this type of Roc clutch, which for the first fifty or sixty miles gave such satisfaction that I placed an order for a new machine so fitted. Later this machine began to get very slow on hills. Of course, everything got the blame, and the local repairer got a lot of cash, and suggested a new belt for which 23s. was asked. My friend was in despair, and one wet day in the spring I enticed him with his machine into my shed. We decided we could not make matters worse, so took, or rather commenced to take, the parts to pieces. We detached the rod from the clutch pedal to the lever working the cam pin, and there was the trouble at once. The pin is squared and the lever also, but the corners of the square had in this short distance worn nearly round. A new lever with the hole cut truly square cured the trouble, and the machine will now go anywhere with sidecar and passenger. Possibly the tip may be of use to those who find the means of adjustment not satisfactory.

Now, will some other rider suggest how the exhaust lifter can be brought near the starting handle? ESSEX.

Valve Cams and Noise.

[3667.]—I have been much interested in reading the description of the new Quadrant engine. Mention is made that the cams are so shaped that the valves open quickly to the fullest extent, remain open the longest possible time, and close quickly.

Now this is violating what I have always imagined to be the very essence of silence, and it seems a pity that it should be incorporated in a new engine of apparently such excellent qualities. Doubtless all your readers are acquainted with the secondary attraction of ginger-beer or even of champagne bottles. If the loosened cork is held down, and then suddenly released, a mild explosion occurs, but if it be first slightly raised, and then suddenly and completely removed there is no noise whatever. Surely it is the same with the petrol motor. If the valves open quickly to the fullest extent the whole blast of the explosion is set free and has to be tackled by the silencer. If, however, the cam is so constructed that the valve is given a small preliminary lift, and then opened to its fullest extent, the noise is appreciably lessened.

I believe the Mercédès cams work on this principle, which is surely proof enough that the operation can be effected in the necessary short space of time.

I firmly believe also that this is in the main the secret of the "Silent Knight," though I have nowhere seen it expressed. However quickly the sleeve moves it is bound to first uncover a very thin slit, which gradually enlarges as the sleeve performs its function. This state of things cannot exist with the ordinary cam and valve, as the first "thin slit" describes a large circle, thus exposing a far larger opening to the exhaust than is the case with the Knight engine.

Of course, if the cams were made on the principle I suggest, there would be a loss of compression, and, consequently, of power, but it would occur so late in the stroke as to render that negligible, and, at any rate, would surely not be such a poison to power as a restricted silencer.

E. A. GIBB.

An All-British Machine.

[3668.]—A short time ago I ordered a heavy twin of British manufacture throughout. In due course the machine arrived, but refused to run satisfactorily. On investigation, the timing of both magneto and valves proved to be hopelessly inaccurate. The inlet valve springs (automatic) were far too weak, and had to be replaced by stronger ones. All went fairly well for about five hundred miles, and then the forked connecting rod snapped at the fork, making such a mess of the engine that it had to go to the makers. They returned it in a week, having practically rebuilt the engine.

Things went on much better now, except for the replacement of a rear wheel cone which had broken, a steering head cap also fractured, twice mending oil tank, two spokes broken at the heads, and sundry smaller breakages. After about 3,000 miles the connecting rod broke again in exactly the same place, and now I am having the engine repaired by an engineer, who tells me the bushes, gudgeon pins, and other parts are made of very poor material.

I received a bill for over £2 from the engine makers for repairs, which, under the circumstances, I refused to pay, since the engine had run only five hundred miles. I received a letter in reply, in which they say: ". . . it is difficult for manufacturers to hold themselves liable for consequential damage owing to the failure of any small part, particularly in a piece of high speed mechanism, such as a high speed motor." This is from a leading firm of engine makers. It is only fair to add that the makers of the frame did all they could to help me, but that did not make up for the incessant failure of various small parts.

I particularly ordered an all-British machine, feeling sure that it would give me complete satisfaction, and I think that for nearly £60 one may expect a good article. However, I have learnt to my cost, as some of your readers have, too, that all that is British is not necessarily good—far from it; and, having learnt the lesson thoroughly, I am awaiting the delivery of a twin of a well-known Continental make.

I would like to say a word in favour of the Celerio belt fasteners. They are particularly suitable for a comparatively shallow belt like the Continental, and are better threaded than most fasteners. 6-7 H.P.

OCCASIONAL COMMENTS.

By "IXION."

Pocket Tools.

We see many tool kits sold especially for motor cyclists, but really only one or two of them are practicable. The main tool kit may be well carried in a big leather roll, provided the roll has proper saddle attachments. The special value of the tool kit system to the motor cyclist lies in the fact that there are three or four small requisites, which he often needs on occasions when it is a nuisance to open up the main kit. The first tool on the list is a screwdriver, the second a tiny spanner, the third pliers, and the fourth a belt punch. I use a Bonza kit, which is no larger than my letter case, and it contains one interchangeable handle, into which screwdriver, chisel, saw, file, and several borers may be snapped. To supplement this, I carry a vest size King Dick, and a belt punch loose in a waistcoat pocket. Will someone supply a pocket kit holding miniature wrench, screwdriver, file, pliers, borers, and belt punch?

Four-cylinder Motor Cycles.

I begin to doubt if we English motor cyclists are taking the four-cylinder machines seriously enough. They will certainly never make a strong appeal to novices, who are sufficiently timid about a single sparking plug, etc., to attend to; but the modern editions of this pattern are undoubtedly very attractive machines. It is a delightful change to mount one fresh from a ride on a thumping single-cylinder, which has proved liable to knock at low speeds, difficult (very possibly) to start, and so forth. The modern four-cylinder starts off its mark with ease in the shortest possible distance, and runs with a perfectly enthralling sweetness at very low speeds, while, odd as it may seem, I am unable to discover any failing in reliability as opposed to the singles and twins. Somehow or other, in spite of its comparatively complicated ignition and valve system, it seems to be as free from involuntary stoppages and to maintain its power at least as

well as the singles and twins. I think a good many of our more expert riders would thoroughly enjoy a year on a good four-cylinder by way of a change.

Cuffs or Gauntlets.

I differ from one piece of advice in Mr. Hart-Davies's notes for winter riders. He advises us to tuck the cuff of a glove inside the coat sleeve to prevent water running into the glove. I have had several narrow escapes of upsets through my coat cuff catching on the handle-bar or brake lever unintentionally, and I make it an invariable rule to have a glove that slips over a rolled or strapped coat cuff, having witnessed one or two nasty tumbles resulting from the opposite habit. Moreover, with the modern low seat and upturned handle-bar, I notice it is very uncommon for a rider's hand to be lower than his elbow—my wrist, when steering a Triumph, is three inches higher than the crook of my elbow—so on all grounds I advise the use of gauntlet gloves. They are also considerably more comfortable than the alternative wind cuff inside the coat sleeve, with its irritating wrist pressure.

A Gudgeon Pin Attachment.

Yet another mode of securing the gudgeon pin has been suggested to me. One of the original set-screws came adrift and caused trouble, so the rider removed both the setscrews, and in their place employed two copper wedges. The ends of the gudgeon pin were split to permit of the setscrews passing through it, and into each of these splits he hammered a copper wedge, filing its outer end off flush with the cylinder, since when he has had no further difficulty. Personally, of all the fastenings I have tried the Riley patent is that which seems most perfectly reliable. The bed for one end of the gudgeon pin is oblong, which entirely prevents the gudgeon pin from turning, while a cotter threaded through its tapered end renders it impossible for the pin to move endways. As there is no movement whatever in the gudgeon pin, the split pin in its end is as safe as a split pin would be if used to lock any other fixed joint, such as the nut on the end of a saddle pin bolt. I believe it is true that no gudgeon pin secured after this fashion has ever given any trouble. I myself have employed it for many thousands of miles, and it has never shown signs of coming adrift, nor do I see how it can.

A MOTOR CYCLE DOG'S AMBULANCE.

A dog's ambulance has just been placed upon the London streets by the Animals' Hospital. Motor cyclists will be interested to learn that this quaint-looking ambulance is drawn by a $3\frac{1}{2}$ h.p. Quadrant motor bicycle, which is found invaluable. The ambulance is coupled to the motor cycle by means of a ball socket coupling, so that in the event of a sudden skid or a sharp turn there will be no danger of upsetting the ambulance, which is padded to minimise any possible shocks. This is another case of the useful services into which a motor cycle can be pressed.

A dog's ambulance drawn by a motor bicycle.

CURRENT CHAT

TIME TO LIGHT LAMPS

Nov. 11th ... 5.17 p.m.
 " 14th ... 5.12 "
 " 18th ... 5.7 "

Another Motor Cycle Club.

A movement is on foot to start a motor cycle club for Devonport and district.

Cambridgeshire Police Active.

We are advised that the police throughout the whole of Cambridgeshire are now very active and are working traps on nearly every road leading to Cambridge within a radius of eight to ten miles. Usually two policemen are engaged, one timing the motorist and the other stopping him if the limit has been exceeded.

Utility of Fire Tricar.

On receipt of a call the other day, we are informed the new motor tricar at the Beckenham fire station was started up within fifty seconds of the alarm, three miles being covered in very fast time. The machine is stationed at the entrance to the station in readiness, and naturally it is kept in spick and span condition.

American Hour Record.

A new American hour record has just been created by Fred Huyck, of Chicago. Riding a 7 h.p. twin-cylinder Indian he covered 61½ miles in the sixty minutes—nearly five miles better than the previous American record. The figures do not compare

very favourably with Collier's recent world's hour record of 70 miles 105 yards on an 8 h.p. Matchless-Jap, but they approach Giuppone's French hour record of 63 miles 1,078 yards on a 10 h.p. Peugeot.

The Number of Motor Cycles.

The estimated increase in the number of motor cycles in use, compiled from figures supplied by the makers of the Bosch magneto machines, will be interesting to riders and makers alike. The article will be found on page 871.

Collier's Record Breaking Machine.

It has been stated that the Matchless machine used by the world's hour record holder was of 8-10 h.p., but we are asked to point out that the engine is a standard 8 h.p. Jap, the cylinders measuring 85 by 85 mm. The identical machine and engine were used in the T.T. Race, and entered as 7 h.p.

Resignation of Mr. de Rodakowski.

The Committee of the Brooklands A.R.C. informs us that Mr. de Rodakowski, whose agreement with the club expired on October 31st, has vacated his office as clerk of the course. Mr. de Rodakowski announced his intention of retiring from his position in June of this year, but he will not sever his connection with the club.

Next Week's Issue.

Next week's issue will be the first of our special Stanley Show issues, and will contain an illustrated article on "1909 Improvements."

1909 Travel Exhibition.

The World's Touring, Sport, Pastime and Travel Exhibition will be held at Olympia in July next. Full particulars can be obtained from the management, 75, Chancery Lane, W.C.

Curious Hill Feature.

We hear that an attempt is to be made to climb Constitution Hill, Chatham, on a standard single-gear single-cylinder motor cycle. It will be necessary to take the right-angled bend at the foot at the best possible speed. Curiously enough, this hill has two names. The board at the top reads "Constitution Hill," the other at the foot says "Grange Hill."

Barnes in America.

Little has been heard of George A. Barnes lately. At present he is in America, and last month paced Hugh MacLean, America's champion pace follower, to victory in a five-cornered hour race at the Clifton (N.J.) Stadium for a purse of 1,000 dollars. The distance covered in the hour was 40½ miles, and the racing was witnessed by 7,000 spectators. Barnes is using a 6-7 h.p. pacing machine almost exactly similar to the one used by Meredith's pacer.

Farlow Bank Climbed.

Two or three readers point out that Farlow Bank has been climbed by a single-gear motor bicycle, although "A 4726" in last week's issue considered it an impossibility owing to the steepness and the bad bends. Apparently, the first rider to climb the Bank was A. M. Lomax on a standard 1908 Triumph belonging to Mr. F. G. Sandison, on the occasion of a competition organised by the Birmingham Motor Cycle Club two months ago. Mr. Sandison has climbed the hill himself, but on the occasion of the competition lent his machine to Mr. Lomax, thinking it was not good policy for him to compete for his wife's prize. H. Rem Fowler is another rider who has climbed the Bank on his 5 h.p. T.T. Norton, but he considers the hill about the worst he has seen or ridden, and as for Sunrising and Birdlip—well, in comparison they are nowhere.

Belgian soldiers carrying staff messages on four-cylinder F.N. motor bicycles.

Trapping Pedal Cyclists.

At the Saddleworth Police Court last Wednesday six pedal cyclists of Oldham were each fined 5s. 6d. and costs for riding at a speed of twenty or more miles per hour down Grotton Brow.

Police Traps.

A trap has recently been instituted at Austerlands, between Oldham and Delph, also between Horse-shoe Clump Hill, and Esher on the Portsmouth Road.

A Monument to Cissac.

A monument is to be erected to the memory of the racing motorist, Henri Cissac, who met his death while competing in the French Grand Prix motor car race this year.

A Motor Cyclist and Lawn Tennis Player.

G. W. Hillyard, the champion lawn tennis player, and well-known as an enthusiastic motor cyclist, is at present on his way to South Africa with Messrs. Doherty, Eaves, and Escombe, the quartette comprising the All English lawn tennis team, to meet the pick of South African tennis players. They will play at Port Elizabeth, Johannesburg, Bloemfontein, and Cape Town.

Incorporated Institution of Automobile Engineers.

Meetings of the committees of the Birmingham and Coventry branches of the Incorporated Institution of Automobile Engineers were held on Tuesday, 3rd November. It was resolved to proceed forthwith with the formation of graduates branches in both cities, and a general meeting of the pupils, apprentices, and junior draughtsmen employed in the motor industry in both districts will be held in the beginning of December. Previous to the December meeting of the Coventry branch Mr. A. Craig will give an address on "Some Features of the Exhibits at the London and Paris Shows." Particulars of the Institution and forms of application for admission may be obtained on application to the secretary, 1, Albemarle Street, Piccadilly, W.

Cambridge University M.C.C. Race Meeting at Brooklands. Start of the handicap race for twin-cylinder machines.

Imports and Exports.

The imports of complete motor cycles show a falling off for the month of October. The value of imported complete machines for last month is £1 248, as compared with £1,633 in 1907; parts of motor cycles are up, viz., £2,190, against £1,936 in 1907. For ten months the total figures are £58,006 against £71,438 in 1907. The exports of machines and parts made in England for the ten months of 1908 are slightly lower than 1907, viz., £44,655, against £45,575. This is accounted for by the decrease in parts exported, £17,079 against £22,835. The value of complete machines has risen from £22,740 in 1907 to £27,576 in 1908.

Re-exports from the United Kingdom.

The increase in the exports of foreign-made motor cycles and parts from this country is quite remarkable. The total figure has jumped from £4,981 to £10,876, only £1,714 worth of this total being complete machines. This points to the fact that colonial firms are building up machines from foreign parts.

Farlow Bank Again Climbed.

Seeing the paragraph in last week's issue respecting the severity of Farlow Bank, Cleobury Mortimer, Dr. J. C. O'Rafferty, of Daventry, and Mr. I. B. Hart-Davies, of Rugby, rode over last week-end, and we hear that both successfully climbed the Bank on their standard 3½ h.p. Triumph machines. Dr. Rafferty does not mention the ratio of gears used, or whether pedalling had to be resorted to.

Dazzling Headlights.

The Committee of the R.A.C. at its meeting on Wednesday last decided that in the opinion of this Committee the use of any dazzling lights on motor cycles and motor cars is unnecessary and objectionable within the London County Council area, and that they should be prohibited. In order that the investigation may be brought to a practical issue the Club proposes to hold a trial of headlights for motor cycles and motor cars in January or February of next year. This trial should encourage the use of efficient but not dazzling headlights.

***TRICARS: Dead, Living, and Unborn.**

MR. DAVIES commenced by humorously saying that a friend told him only this week that he was really going to the Club to pronounce a funeral oration over the ashes of countless dead tricars. No doubt hundreds of dead tricars had departed to that mysterious bourne where all the bad motors go, and where he piously hoped they found no more peace than their users had found when the tricars were with them. It was also true that there were very few really "live" tricars remaining on the road or on the market to-day. But he hoped it was equally true that out of the ashes of these dead tricars there was going to spring a new type of machine, cheaper, lighter, more reliable than its predecessors. In that event he was sure his friend Mr. Hooydonk would agree with him in expecting there would be something of the Phoenix about it.

Things were not quite ripe yet for this resurrection; motor cyclists needed a little education before that time came. Many keen riding amateurs could not afford cars, they detested sidecars, and liked to take a companion with them on their rides. These all wanted tricars, but did not know where to find a good one. On the other hand, men in the motor cycle trade wanted to expand their business. It might be said all that was necessary was to put these two parties in touch with each other. But, unfortunately, that was impossible at present, as the wants of this potential tricar

public were so varied, not to say absurd. One wanted a 16 h.p. four-cylinder tricar, and did not mind price, so long as it did not give him any trouble. Another wanted a 5 h.p. water-cooled type with three speeds and reverse, only it must not cost more than £60. No two men wanted the same thing, and all wanted at least twice as much as they could ever expect to receive for their money.

Mr. Davies asked that two points might be considered in view of these extraordinary demands. The first was, what is the price limit for a future tricar which a large enough public could pay, and the price at which the trade could supply a machine?

Specification and Price.

Secondly, what sort of a specification could be expected at that price? It was said the tricars of the past had been killed through faults of design and workmanship. He denied that emphatically. Early motor bicycles suffered more than the tricar had ever done from these faults, but the development of the motor bicycle had proceeded in a steady, unhesitating march towards perfection, until to-day it was nearly perfect. At the present moment there were only about four makes of tricars on the market. The analogy of the motor bicycle proves that the faults of design and workmanship were not the prime cause, though they might have been a secondary cause, of this failure to become popular. In his opinion, they died out because of their price—from £100 to £150 apiece. To-day, matters from a price point of view

* Summary of a paper read by Mr. R. H. Davies before members of the A.C.U. at 112, Piccadilly, W., on November 5th, 1908.

Tricars: Dead, Living, and Unborn.—

were even worse. If he were entering the tricar trade, £60 would be the figure at which he could reckon on a decent demand, and £70 would be the absolute limit.

For this amount it was impossible to supply a tricar possessing a miniature four-cylinder engine, a three speeds and reverse gear box, and 3in. tyres on all wheels. He did not profess to say what the trade could offer at the figure suggested, but obviously, if we were going to get any good new tricars, it would mean relentlessly paring down any costly luxuries and refinements.

From his own experience he wished to state what he considered would be a specification for a roadworthy tricar for which he would be prepared to pay £60 or £70.

Sketching out broadly a specification for the tricar of the future, he asked his hearers to keep the Rex Litette in mind, because everything obviously depended on the engine power required. He would choose a 5 h.p. twin. It was far more flexible and vibrationless than the best singles. As to cooling, it was a common idea that air-cooled engines overheated in tricar work; but he had never known an air-cooled engine, specially designed for tricar work, do that. The overheating bogey in connection with tricars was due to the old habit of bolting a forecar on to a motor bicycle, possessing a high compression engine, designed to extract the last ounce of kick out of a given cylinder capacity. Many people have had their sole experience of air-cooled tricar work with high compression engines, which were very prone to overheat. Against that experience, he related how he once broke the high gear chain on a Vindec, and drove it for twenty miles in an hour on the low gear of 9 to 1, and it did not overheat, but of course he gave it quantities of oil. He believed, therefore, that a low compression 5 h.p. twin-cylinder engine would supply the requisite power, and would never overheat if properly lubricated.

The frame. He believed it was possible to manufacture a tubular frame more cheaply than any other, and so he advocated a tubular frame. He saw no reason why an open frame should not be made as free from whip as a diamond frame. He demanded a rigid rear frame and a sub-spring fore frame, with the front seat insulated by Cee springs and the driving seat by coiled springs, a sprung hinge on the lines of the Zenette frame, or a rear cantilever seat such as is found on the Rex Litette.

The Ideal Transmission

must be two-speed (not three or reverse) and chain drive. He considered the original Riley or Humber gears simple and reliable.

Seats must be cheap; cane or wicker in front, big saddle astern. Coachbuilt seats might be listed as extras.

Brakes. The best and simplest rear brake, he found, was to have a dummy belt rim with a brake shoe. The front wheel brakes became more reliable and efficient if the diameter of the drums be increased to about twelve inches.

The remaining details of his ideal specification approximated very closely to the high-grade motor bicycles of the present day. Instead of a fragile accumulator and coil, a high-tension magneto would be demanded. If some of the early tricars had possessed this most reliable of all known ignitions they would not be discarded to-day. Instead of carburettors with inaccessible jets, loosely-made throttles, and dozens of small screws and parts, we shall demand one of the more modern cleanly-cast vaporisers, with instantaneously detachable jet. Instead of the old 2in. tyres with thin treads, we must demand 2½in. or 2½in. covers with thicker understandings, and the rear cover must have a detachable or butt-ended tube.

If he was right about price, the matter of specification would solve itself automatically, as the maker would be limited. In his opinion, the only hope of a fresh boom in tricars lay in the marketing of a very simple, light, air-cooled chassis on cycle lines, at a price not exceeding £70.

THE DISCUSSION.

THE CHAIRMAN (Dr. E. W. Brewerton) complimented Mr. Davies on the admirable way in which he had stated the case for the makers. Personally, he thought both the high-priced, heavy tricar and the low-priced one were dead. The big tricar had been killed by competition from the small motor car, and the small-priced tricar had been driven out by the sidecar attached to a motor bicycle. The new tricar would meet its keenest competition from the latter vehicle. He thought, however, they would have to go as high as £80 for

a good tricar, so as to get something rather better than a sidecar. He heartily agreed with Mr. Davies's proposals as to the engine; a twin-cylinder would be essential, and of 5 h.p. A single-cylinder engine was a horrible jumper. The cylinders must be accessible. As to transmission, this must be by chain drive, with gear box, as no belt would drive a machine which weighed 4 cwts., and when carrying two passengers and luggage the weight would be brought up to 7 cwts. Two speeds would be sufficient; reverse would be quite unnecessary. Back springing was absolutely essential for the sake of the machine as much as the passengers; without back springing the nuts would become loose and spokes break. Magneto ignition seemed to be possible with a three-cylinder engine. With regard to tyres, it appeared to him that the lighter the machine the heavier the tyres required to be. If there was light framework, there must be large diameter and heavier tyres to save the frame from breaking. He thought 3in. to 3½in. voiturette tyres were necessary. These would never burst. He had driven a heavy tricar 15,000 miles and only had one puncture, and that was before he had big tyres put on. Mr. Davies's proposition as to the tricar of the future, with a few alterations, he thought would eventuate in a successful machine.

Mr. J. TUCHMANN said the tricar when it first came was going to be the passenger vehicle of the future, but it had not lived up to that prediction. It had formidable rivals. To review how it came into existence was interesting. It first had two wheels in front and one behind, the rear one being the driving wheel; this was because the bicycle was so driven. But in some countries this design changed, and the front wheel is the driving one. In Berlin, where there are a lot of tramlines, he had seen machines running about the streets of a very convenient type. They were used greatly by the large emporiums there, and were easily manipulated in the traffic. They seemed rather expensive—he thought about £120. They had air-cooled engine fitted in front, by far the best position from a cooling point of view. The driving wheel was in front; they did not skid. Certainly the tricar had very severe competition to reckon with. No doubt motor bicycles would be getting cheaper; then the tricars would have to follow suit. He preferred motor bicycling to riding in a tricar, yet he thought there might be a future for the type of machine he had described which he saw in Berlin.

Mr. A. C. PEMBERTON related at some length his experiences with a light machine. Since 1904 he had driven it 20,000 miles, which he considered a good test, and he was perfectly pleased with it. It was an Excelsior bicycle fitted with a forecar. Its total weight was 2½ cwts., and it had a two-speed gear.

An Economical Tricar.

Its petrol consumption for a 500 miles run was 124½ miles to the gallon. This was on fairly level roads. Its highest consumption came out at 89.9 miles to the gallon; that was going North into Yorkshire and about the Peak District. His longest delay was one half-hour, and it had something to do with the ignition, but it put itself right. The drive was by an ordinary threequarter Watawata belt, which he found to be all that could be wished for. He used 2in. or 2½in. Clincher tyres, and they lasted a year. He found Palmer's ordinary fabric tyres excellent in wear on the back wheel. They ran 2,000 or 2,300 miles. At present he had a 2½in. Palmer cord tyre, and it had gone 2,000 miles and looked good for another 2,000. When voiturette tyres were used a big engine was needed.

Mr. SIMMS said he had had experience with tricars, motor bicycles, and motor cars. He began with an old Singer tricar, and then purchased several classes of motor bicycles, also an Argyll car, then another Argyll car, and he was now driving a Phoenix Trimo. The last named was the cheapest and most satisfactory machine he had ever had in his possession, and he had had no less than fourteen different classes of machine altogether. The Trimo had Palmer cord tyres, and had always been absolutely reliable. It did a lot of work every day, and he had taken his wife with him touring on it nearly all over England, and he had never had any stop or any trouble with it. It took any hill, and had never stopped on a hill. He often went to Tunbridge Wells on it, and always ascended River Hill without the slightest trouble. He thought it surprising that the public did not take to the light tricar. The Phoenix Trimo cost very little to run. His conviction was that the light tricar was far from dead, and the public would begin to find out their mistake. The public expected too much from these light

Tricars: Dead, Living, and Unborn.—

tricars; when they took to them again they would find their advantages. They cost very little, they were cheap to run, easy to start, very accessible, and not the least advantage was that they were so light. When once a tricar was put on the market at about £60, he thought the public would take them up again.

Mr. A. F. LISLEY congratulated Mr. Davies on sectionising his remarks as he had done. From the dead tricar to the unborn one was about as wide a leap as one could wish to get. He did not agree that price had killed the tricar, but, taking each individual type, it would be ascertained that it had some shortcomings which would give the reason why it had dropped out of existence. Nor did it necessarily follow that because a particular machine was not made to-day that that type of machine had been killed. Some discreet makers might have decided not to force a certain type upon the public when it was not desired. The decline of the tricar dated from the inception of the heavy machine. He would like to have heard a longer statement as to the tricars that are living to-day. He thought they lived because they embodied a correct principle—a principle which had been correctly carried out, one in which the taste or scramble for high-powered machines had not been pandered to to any great extent. It seemed to him that those machines which pursued the middle course had survived. With regard to the tricar unborn, Mr. Davies had tackled a very great problem. Here was a large field which should be approached with a great amount of diffidence.

Price the Stumbling Block.

The tricar of the future, he believed, would prove to be the tricar of early days—a prototype of the 1904 and 1905 tricars. Of course, the great stumbling block was price.

Mr. F. A. HARDY, as an old motor cyclist, said he had two tricars, representing the two ends of the argument they had had that evening—one a small one with air-cooled engine, the other one of those big things which had been decried so much. He had had a great amount of fun out of both. A tricar is much more sociable than a motor bicycle, and you do not part company with your passenger. He commenced to use a tricar in 1905. Before that, when he wanted to take his wife out with him, he attached a trailer behind, until one day the hind wheel of the trailer was caught by another vehicle when they were travelling round a corner, and the trailer was overturned. He then got a 3 h.p. Quadrant tricycle, which had been transformed into a tricar. This was a success in every way except that the belt was a little troublesome. He thought that for £60 a tricar with the bare necessities on it could be produced, but that for £80 something in the way of luxuries might be looked for.

Mr. W. RANDLE thought the question was practically one of personal taste. He started motor cycling with a bicycle, and had very good times, but got tired of it and added a trailer. That took him back nine years. With the trailer he had an accident. After that he bought a Phoenix Trimco, on which he and his wife had some good sport. The belt

was somewhat of a trouble. He had also a light Garrard, and at present he was driving a Lagonda, which he had used for the last three years. He was favourable to the heavy tricar, although he acknowledged some advantages in the light one. If out with a sporting motive the driver wanted power; on the other hand, a light machine would do for a twenty-five miles run. For touring, a heavy one was preferred.

Mr. BOILEAU (*The Motor Cycle*) added a few words from his experience of tricars, beginning in 1904 with a 3½ h.p. motor bicycle and forecarriage attachment. This machine needed a good many additions, especially a good two-speed gear. The belt, too, gave trouble. He then got a tricar with chain transmission and a very simple form of two-speed gear. It was light, handy, well made, and most reliable, but it was most uncomfortable. The springing of the front seat was not very good, but that was a point which could easily be altered. His opinion was that eventually that type of tricar would prevail which was fitted with magneto ignition. The heavy type which had been condemned was a thoroughly practical vehicle; it had been killed by the cheaper forms of cars put on the market. A good deal had been said about the future change-speed gears of the tricar. There were two types of gear—the epicyclic and the sliding type. If the future type was to be the sliding gear box, a three-speed gear would be quite practicable. He thought the complete machine would come out between £75 and £80. He did not think they ought to grumble at £80.

An Experienced Tricarist's Views.

Mr. W. GUNN, who had been associated with the heavy tricar for the last three years, said everyone who took up the tricar had simply gone the way of all motor cyclists who went in for the passenger machine; they commenced with the smallest and lightest, first a two-seated tricycle, then a motor bicycle with a trailer, then a belt-driven tricar such as Mr. Pemberton described, and so on to the very heavy machine that they had come together that evening to mourn, or to rejoice over, as the case might be. He thought the whole question was one of price.

Mr. W. PRATT thought the sidecar was the cause of the death of the tricar. He knew many who said they preferred the sidecar both to the light and the heavy tricar. He asked the lecturer if he had seen the A.C. tricar?

Mr. DAVIES: Yes, I have seen it once on the road, and I have the drawings of it in my study now.

Mr. PRATT (continuing) said he thought it would meet a great demand, although it did not get through the Quarterly Trials successfully.

Mr. J. VAN HOOYDONK said Mr. Davies's lecture resolved itself into a commercial proposition, which was a very sensible way of looking at it.

The CHAIRMAN then called upon Mr. Davies to reply, which he did briefly. The hour was by this time very late, or he would have fully gone over the many interesting points raised in the discussion.

Votes of thanks to the lecturer and to the chairman closed the proceedings.

"THE AUTOCAR" LECTURES.

FIVE of these lectures have now been given in the London and three in each of the provincial centres. The dates of the remaining lectures in each centre are as follows:

LONDON.—3.30 and 8.30 p.m. November 17th, 24th, and December 1st.

BIRMINGHAM.—7.30 p.m. November 11th, 18th, 25th, December 2nd and 9th.

LEEDS.—7.30 p.m. November 12th, 19th, 26th, December 3rd and 10th.

MANCHESTER.—4.0 and 7.30 p.m. November 13th, 20th, 27th, December 4th and 11th.

NEWCASTLE-ON-TYNE.—7.30 p.m. November 16th, 23rd, 30th, December 7th and 14th.

Synopsis of lectures:

FOURTH LECTURE.—Clutches: Cone, Expanding, Metal-to-metal, Disc, etc.—Gear Boxes—Cardan-shafts—Universal Joints—Back Axles.

FIFTH LECTURE.—Carburation—Cooling and Lubrication.

SIXTH LECTURE.—The whole of this lecture will be devoted to various forms of ignition, particular attention being given to High Tension Distributing Systems and Magnetos.

SEVENTH LECTURE.—Frames — Steering — Brakes — Bearing Chains, etc.

EIGHTH LECTURE.—Bodies — Wheels — Tyres — Accessories — Hints on Driving—Organisation.

To meet the wishes of some of our readers it has been arranged to issue tickets to admit to *any four* of these lectures at a fee of 10s. 6d.

Applications for tickets should be made immediately to the Lecture Secretary, 20, Tudor Street, E.C.

THE NEW PENNY EDITION OF "THE AUTOCAR."

Readers of "The Motor Cycle" who are interested in motor cars are reminded of the new Penny Edition of "The Autocar," now obtainable of all Newsagents and Booksellers every Friday Morning.

CAMBRIDGE UNIVERSITY M.C.C. RACE MEETING.

A SMALL race meeting of an entirely private nature was held at Brooklands on Saturday last by members of that enthusiastic body, the Cambridge University Motor Cycling Club. The weather was all that could be desired, but a cold easterly wind blew across the track. The first event was a scratch race for single-cylinder

twin-cylinder machines fitted with engines of any size, Mr. Milbourne was the winner. The open three-lap race was won by Mr. E. H. Lees (5 h.p. Peugeot). Next followed a motor bicycle v. car race, in which the participants were Mr. A. H. Moreing, the secretary of the club (38.1 h.p. Daimler), and Mr. E. D. Dickson (5 h.p. Vindec). The result was a

A group of competitors and officials at the Cambridge University M.C.C. Race Meeting at Brooklands on Saturday.

machines to decide the handicap, and in this Mr. J. H. Whitlark (2½ h.p. M.M.C.) was first, and Mr. J. Ashworth (2½ h.p. Minerva) was second. In the race for twin-cylinder machines fitted with engines not exceeding 76 x 76, the winner was Mr. E. D. Dickson (5 h.p. Vindec), and Mr. R. G. Heyn (5 h.p. Rex) was second. In the scratch race for

win for the car by about 5s. The handicapping was most ably carried out, as not more than a second separated the first and second men in most of the events. The officials to whom the success of this excellently managed meeting was due, were Messrs. C. H. C. Smith and U. F. M. Oliver, timekeepers; and Mr. A. H. Moreing (the secretary), starter.

CLUB NEWS.

Coventry M.C.

At a committee meeting of the above club on Wednesday last, the decision of the A.C.U. Formula Sub-committee, which met to consider the A.C.U. formula when applied to two-stroke motors, was discussed. The committee of the Coventry M.C. unanimously decided that the decision could not act retrospectively with regard to the motor cycle hill-climb at Newnham. The published results therefore hold good.

Hull and East Riding A.C.C.

After a most successful year the Hull and East Riding Auto Cycle Club held its annual dinner at the Grosvenor Hotel on Thursday last, with the president, Dr. W. H. Coates, C.C., of the Army Motor Reserve, in the chair. There was a large attendance, several of the lady members of the club being present. The loyal toast was submitted from the chair.

Following the usual speeches was an excellent programme, during which the prizes won during the year were presented by the chairman, who also, on behalf of the members and friends, presented to Mr. Straker, the indefatigable secretary, a gold watch in recognition of the very satisfactory way in which he had discharged his duties. The presentation was made amidst hearty applause, and suitably acknowledged by Mr. Straker.

Brighton and District M.C.C.

This club concluded a very successful year with a hill-climb. The venue chosen was known as Captain Kidd's, near Hartfield, with an average gradient of about 1 in 8, with parts of 1 in 5, and one mile in length. The surface was very fair, but had small patches of grease on the worst corners. The following were the starters and order of finishing:

Twin-cylinder Class.—1, R. W. Cartwright (7-8 h.p. Minerva); 2, W. Brett (5½ h.p. Rex); 3, J. Coleman (5 h.p. Rex); H. Saunders (5-6 h.p. Bat-J.A.P.), J. Best (4½ h.p. Minerva), and G. H. Nottingham (3½ h.p. Alcyon).

Single-cylinder Class.—Not enough of these machines turned up to make a class, but Mr. Hale was timed up the hill on his 3½ h.p. single-cylinder 1908 Rex, and made an excellent ascent in 3m. 7s.

A whist drive is to be held to-morrow (Thursday), and members are requested to turn up in full force to do justice to the delicacies provided by the host, Mr. Smith.

Members are reminded that the mud-pluggers intend to hold informal runs throughout the winter.

Essex M.C.

Now that motor cycles have attained such a degree of reliability there is no need to store them away during the winter months. The above club therefore intends to hold week-end runs throughout the winter months, alternately to the George at Bishop's Stortford and the White Hart at Witham, or if desired the destination may be varied. The first of such runs will be held on the 22nd inst., lunch at the George Hotel, Bishop's Stortford, at 1 p.m.

Edinburgh M.C.C.

The single-cylinder class in the hill-climb organised by this club held on October 24th has been settled. Owing to the most unusual closeness of the first two competitors the matter was referred to the Editor of *The Motor Cycle*, and acting on his advice the Trials Committee has declared this class to be tied, with S. Thomson (3½ h.p. Triumph) and R. H. Mouat (3½ h.p. Griffon) first equal, the latter making the fastest time by 1½s. The following is the position of the others who ascended the hill:

	Figure of merit.	Behind fastest time.
3. J. Cameron (3½ h.p. Triumph) ...	105.3	7½s.
4. T. Durie (3½ h.p. Triumph) ...	106	8½s.
5. G. A. Bostock (3½ h.p. Triumph) ...	114	17s.

Cambridge University M.C.C.

The following are the results of the Croydon hill-climb, held on October 31st last:

Rider and machine.	B. & S.	Time.	merit.
C. L. Mere (3½ Triumph) ...	84 x 86	25.9	37.93
— Stapler (3½ Triumph) ...	84 x 86	28.6	39.69
C. Stephenson (5 Vindec) ...	75 x 76	25.8	39.95
E. D. Dickson (5 Vindec) ...	75 x 76	25.8	42.29
E. H. Lees (5 Peugeot) ...	75 x 75	21.8	44.15
N. W. Hutchinson (3½ Triumph) ...	82 x 86	33.0	44.6
— Perkins (3½ Peugeot) ...	66 x 70	30.5	47.33
G. Seth-Smith (5½ N.S.U.) ...	75 x 75	30.0	50.02
J. M. Oakey (5 Vindec) ...	75 x 76	32.3	54.4
F. M. F. Pilkington (7-9 Peugeot) ...	80 x 98	21.4	57.03
W. B. R. Moorehouse (7-9 J.A.P.) ...	85 x 95	23.1	67.13

Fastest time was made by F. M. F. Pilkington (7-9 h.p. Peugeot). The timing was effected by means of an electrical apparatus designed by Mr. F. P. Dickson and Mr. U. F. M. Oliver.

The Possibilities of a Light Tricar.

READERS will remember that a few weeks ago we wrote a leaderette on the possibilities of the light form of air-cooled tricar. The article was inspired by a few months' use of a light tricar built to our order by the Rex Motor Mfg. Co., Ltd., and which we understand that the firm named has resolved to standardise and exhibit at the forthcoming Stanley Show. When we ordered the machine the Rex Co. had no idea of marketing it, but they kindly carried out our wishes and built it entirely in accordance with the suggestions we made at the time, which were to take one of their standard $3\frac{1}{2}$ h.p. single-cylinder motor bicycles with Rex two-speed gear and Roc clutch and build it up with a Litette forecarriage, but instead of springing the front axle to spring the front seat. With this combination all our expectations have been realised, for the tricar has given no trouble, with the exception of a slight derangement of one of the engine ball bearings and a tendency for the low speed brake drum to slip on a very steep hill. Both these little faults have been remedied, the former by the alteration of the design of the bearing, the latter by altering the brake band to increase the gripping power. The illustration of the machine shows that the frame at the rear is exactly the same as an ordinary $3\frac{1}{2}$ h.p. Modèle de Luxe bicycle with two-speed gear. In other respects the only departure is in the method of operating the clutch and two-speed gear, which is by a hand lever, clearly shown in the illustration. We prefer the hand lever, as both feet are free to operate the brakes, and, moreover, there is no necessity to keep the foot on the low speed pedal (as in the case of the bicycle), as the lever is provided with a notched quadrant to hold it in the low speed position as long as required. In the central notch, the engine is free for starting by means of the handle fitted to the right-hand side of the live axle. A forward movement of the lever engages the low gear gradually, and a backward movement brings the low gear out of engagement and engages the high speed clutch.

Other Details of the Tricar.

The engine is fitted with an Amac carburetter, handle-bar controlled, and underneath the front seat is a long round silencer extending nearly the whole width of the front axle. This special silencer renders the machine very much quieter than the majority of motor cycles, unless it is climbing steep hills with throttle full open. On the engine shaft is an Advance adjustable pulley, which has given every satisfaction. The transmission is by $1\frac{1}{8}$ in. Giant Watawata belt. This belt, after being taken up in the initial stages, has received no attention beyond scraping in about 500 miles running. For passenger work, there is no doubt if belt transmission is employed the belt should be well above the work required of it. That is the reason we specified a $1\frac{1}{8}$ in. Watawata belt in preference to a standard $\frac{7}{8}$ in. or 1 in. belt, which, although quite

adequate for solo work, naturally gives more or less trouble on a passenger machine. It will be noticed that the engine, magneto, etc., are well guarded by means of a metal pan fitted under the engine and up to the side members of the frame; the pan is also closed in front. The front wings are very wide, and have leather extensions at the ends; in addition, a metal splashguard is fitted between the seat and the wheel, effectually preventing mud and water from reaching either the passengers or the engine and magneto. In fact, the whole of the rear part of the machine keeps

Rex $3\frac{1}{2}$ h.p. light passenger machine, a type which will be exhibited at the Stanley Show.

remarkably clean, and the only portions which get splashed when running on muddy roads are the back stays and chain stays; and all behind the rear wheel from a vertical line drawn through the centre of the saddle seat. This latter, by the way, is a Brooks saddle seat with compound springs, and in combination with the Rex cantilever spring seat-pillar is extremely comfortable—in fact, on fairly good roads one would hardly believe that the tricar had a rigid frame. To the right of the saddle, and strapped to the back stays, is a leather holster for carrying the starting handle, and a tyre foot pump is attached to the steering column. On the footboards behind the front seat are two neat boxes. The one on the right-hand contains a drip generator for the acetylene lamps, the other is a case of tools. The cane forecarriage is provided with a strong apron and a compartment runs the whole width of the seat just above the footboard. This is very handy for carrying a spare air tube, etc. The tyres are a 26 in. \times $2\frac{1}{2}$ in. Clincher on the rear wheel with a small car air tube; the fronts are 26 in. \times $2\frac{1}{4}$ in. Avon. The lamps are the new F.R.S. recently described in our article on motor cycle lamps, and the F.R.S. generator which we have received for trial. We intend to fit the latter to the diagonal tube.

We can confidently recommend a machine of this description to any motor cyclist who wants a passenger vehicle for use on good roads where the hills are not excessively steep, and where economy both in petrol

The Possibilities of a Light Tricar.—

consumption and tyres is a consideration. As an example of what it will do in the way of hill-climbing, it has been up the first portion of Sunrising with two up, and completed it with one up. It has also completed the whole round of the Wye Valley at an average speed of about 18-20 miles an hour. The gear ratios are 5 and 10 to 1, and unladen it does not exceed 3 cwt. For heavy winter roads and hilly districts the single-cylinder engine gives barely sufficient power,

but we understand the Rex Co. will fit either single or twin-cylinder engines—in fact, we are about to try our own tricar fitted with a 5 h.p. twin engine, and shall be most interested to see if it will keep as cool as the single when run on the low gear. We think it will, because it is being made with a specially low compression, as was the single-cylinder. The tricar is finished in light French grey with dark lines, so that it always presents a light and clean appearance despite dust and splashes of mud.

Hints and Tips for Motor Cyclists. By Road Rider.

MUDFLAPS.

263. The usual type of mud-flap, fitting circumferentially round the wheel, is not remarkably efficient, as the mud splashes often cannon wide of it, and are flung by draughts upon the rider's legs, or caught by some portion of his anatomy before the splashes have time to fall. Wherever there is sufficient clearance a mudflap extending out radially from the wheel will be found to afford far better protection. Even when there is only bare clearance between the magneto and the front mudguard, there is often room to fit a practically horizontal extension of the front guard, and this will be found twice as efficient as the usual type, which is shaped to follow the front wheel. A similar principle may well be applied to the back guard for winter riding, and will keep mud off the back of the engine, and also off bags or other articles strapped to the carrier.

ANGLE OF PROJECTOR HEADLIGHTS.

264. The normal acetylene projector will be found to concentrate its rays at a point too close to the rider if its carrying brackets are strictly vertical. If it is tilted upwards a little its long distance rays are of far better service in night riding. A hood is then required to deflect some of the light down on to the number-plate, and the reflections from this hood simultaneously serve to light up the road surface close under the front wheel, and enable the rider to dodge stones, hedge cuttings, and rough bumpy places.

PEDALS AS FOOTRESTS.

265. To mount by a swinging pedal is a method almost certain in time to lead to disaster, and the foot-rests on most modern machines are too far forward to mount from. If a rider is accustomed to mount from the near side he should screw a steel eye into the near crank, close to the pedal spindle, and stretch a coiled spring from this eye to any suitable point on the frame, in such manner that the pedal is held by the spring at about the 8 o'clock position. The pedal is then always in the correct position for a mount, and should the pedal gear be required for testing the engine on the stand, or for assistance up a particularly bad hill, it is always a simple matter to unhook the spring. Riders who never use their pedals as such can obtain a comfortable choice of riding positions by reversing one pedal on the

crank spindle, so that the two are pointing vertically downwards, using a spring to keep them from swinging.

CHOKED SPRAY IN INACCESSIBLE CARBURETTER.

266. If an engine will not start, and time presses so that the dismantling of the carburetter is unwelcome, it is a good plan to inject petrol liberally into the cylinder or cylinders, and then to make a fresh effort to start the engine with the handle, pedals, or running along, as the case may be. The petrol will produce one or two powerful explosions, and very often the suction so induced will drag the obstruction out of the jet, and so delay the moment when the cleaning of the carburetter becomes indispensable.

SECURING H.T. MAGNETO TERMINALS.

267. The spring push terminals of the high tension wires to a magneto are not always vibration proof, and may occasionally jump off and necessitate a dismount. The simplest way I know of securing them is to make the wires a trifle longer than was previously necessary, and then to procure an indiarubber letter band about six inches in diameter. This is slipped over the end of the magneto, the springpush terminal put in place, and the thong then passed over so that it nips the wire against the horseshoes. The cost of this device is only one penny, and no terminal so fitted can ever jump off. A somewhat similar tip serves to protect these terminals from short-circuiting through wet. The magneto terminal is unscrewed. Its projecting end will be found to be tapered. A circular piece of cycle patching rubber is taken, and a small hole cut in the centre of it so that it slips up the terminal almost to the end. The terminal is then replaced and the wire attached, with a tiny rubber ring threaded on the wire. The loose edges of the disc of patching rubber are then folded down to entirely cover the brass eye of the wire, and the little rubber thong slipped over the crumpled rubber to keep it in place. This affords absolute security from shorts due to rain or mud.

EASY STARTING.

268. Pending the general adoption of carburetters on which both top and bottom air are adjustable (the only ideal arrangement), most carburetters which are adjusted to give the best possible supply of air at full speed

afford too weak a mixture for really easy starting. I recently adapted a Brown and Barlow as follows: The difficulty in starting was traced to a surplus of bottom air (non-adjustable). I therefore got a piece of brass turned up very thin and light, exactly the shape of the lid of a circular cigarette tin, but smaller; its diameter was a shade less than the internal diameter of the bottom of the spray chamber. It was drilled centrally, so that it could be threaded over the jet holder, and put in the carburetter, so that it lay over the bottom air orifices. A stout crosswire fixed to the jet holder prevented it being sucked up into the inlet pipe. It was placed with its up-turned rim on top. I found there was no need to tickle the float needle to get a start, and that the machine started at a far lower speed than ever before. At high speeds the light brass disc lifted well up in the spray chamber, and an ample supply of air was sucked up through its central hole, which was somewhat larger in diameter than the jet holder, as there was naturally a surplus of metal round the base into which the holder screwed. Devices are now obtainable for varying the amount of opening of the air intake.

(To be continued.)

Motor Cycles & How to Manage Them.

Price 1/2, post free. 12th edition.

Entirely rewritten and brought right up to date. Useful alike to expert and novice. The whole of the information given is applicable to any of the leading makes of motor cycles on the market.

Hints & Tips for Motor Cyclists.

Price 1/2, post free.

Reprinted from *The Motor Cycle*, and will be issued in book form for the first time at the Stanley Show. Orders for the first edition should be placed at once.

"The Autocar" Folding Map of England and Wales.

Price 8/10, post free.

A real necessity when on tour. It is well printed on linen, and folds up into a neat and strong case, 7½ x 9½ in. An indispensable motor cyclist's companion.

A full list sent on receipt of postcard.

ILIFFE & SONS LTD.,
20, TUDOR ST., LONDON, E.C.

THE ROC—Its Rapid Rise.

The rapid rise of the ROC to foremost place among motor cycles is due to natural causes—a common-sense construction—a sensible means of starting and stopping—the sensible plan of starting from rest and proceeding in comfort at slow or any pace up any gradient and with safety in traffic. The ROC is often spoken of as “the car on two wheels” by reason of its hand-starting and car-like control. The ROC is a pioneer machine—the long, low, safe design of the ROC military models are known all over the world.

ROC 4 h.p. Royal Military Model, ball bearing engine, clutch and two-speed gear, etc., selling at 48 gns. inclusive. The 1909 models contain several detail refinements, notably in relation to perfection of spring forks and brakes. These will be conspicuous at the STANLEY SHOW. Orders are already being booked.

A. W. WALL, Ltd.,

Roc Motor Cycle Works,

Aston Rd. and Dartmouth St., BIRMINGHAM.

Telephone: 5712. Telegrams: “Roc, Birmingham.”

The ROC conversion set is the one thing needed on any motor cycle. Write for illustrated pamphlet to Clutch Dept., A. W. Wall, Ltd., Aston Road and Dartmouth St., Birmingham.

“GRADUA” INFINITELY VARIABLE GEAR

JUST A GENTLE TURN OF A SMALL WHEEL—THAT’S ALL!

RESULT—ANY GEAR DESIRED BETWEEN $3\frac{1}{2}$ to 1 and 10 to 1.

DEMONSTRATION FREE

AT OUR WORKS (BY APPOINTMENT).

WORKING MODEL AT STAND No 124

(WHICH WILL BE THE GREAT CENTRE OF INTEREST FOR MOTOR CYCLISTS AT)

STANLEY SHOW.

The “Gradua” Gear has most successfully solved the great problem of satisfactory change-speed gear. (To save needless correspondence, we beg to say that we will not fit to other makes of machines, at present.)

“ZENITH-GRADUA”—The high-grade motor bicycle, rigid frame, Druid spring forks most luxurious fitments throughout, will be exhibited for first time.

“ZENETTE”—the patent “double-scissors” spring frame motor bicycle, luxurious to a degree. Its absolute reliability has been fully proved in the various 1908. reliability trials, etc., in which it has been ridden. Fitted with “Gradua” Gear (just a gentle turn of a small wheel—that’s all!).

ZENITH MOTORS, LTD., 119, STROUD GREEN ROAD, LONDON, N.

Stations—Finsbury Park, G.N.Ry. Crouch Hill, Mid. Ry.

The well-known “Zenith Bicar,” “Zenith” Tricar, and “Zenette” Tricar-de-luxe will also be on show.

In answering either of these advertisements it is desirable that you mention “The Motor Cycle.”

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

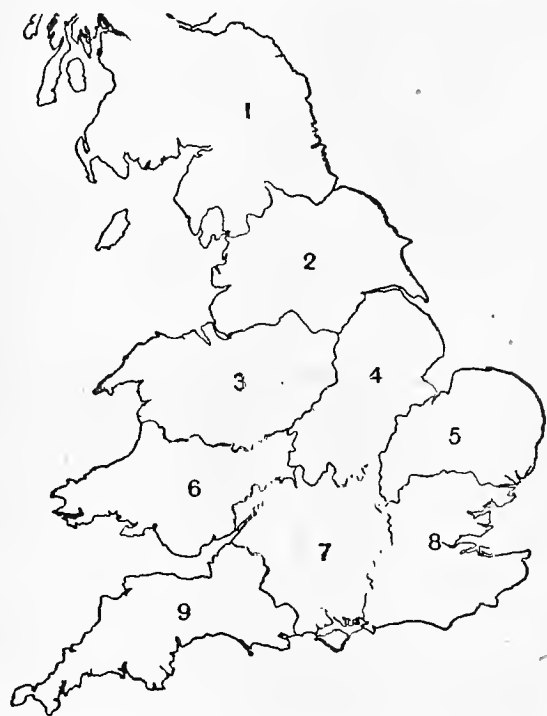

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London (20, Tudor Street, E.C.), by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

THE NEW PREMIER HORNS.

BINOTE. TRINOTE.

BETTER THAN THE ORDINARY HORN,

because their sound carries twice as far and is less offensive—more musical.

For town riding, they are audible above the rumble of dense traffic.

They will be the most popular road-clearers for 1909.

ON THREE DAYS' APPROVAL.

WRITE FOR LISTS OF ACCESSORIES.

PREMIER MOTOR AGENCY,

Aston Road, BIRMINGHAM.

Telephone 4,310. Telegrams: "Primus, B'ham."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE

ACCUMULATORS

Does your present battery leak?

Does it ever run down unexpectedly?

Does it play you tricks and leave you stranded miles from anywhere?

If so, send it along to us and we will either make a thorough repair, or take it in part exchange for a new E.P.R.

E.P.R. No. 19c. 4-volt. 10-amp. Price 10/6.

Size 2½ x 2 x 6in. (over Terminals). Unspillable type 2/- extra.

E.P.R. No. 20c. 4-volt. 20-amp. Price 14/6.

Size 4 x 2½ x 6in. (over terminals). Unspillable type 3/- extra.

Our Batteries are especially suitable for Motor Cycles. Special Splash Proof Vents and Non-Corrosive Terminals are always fitted. The cases are exceptionally strong and well made, allowing for rough roads and jolting.

Special unspillable batteries made, all sizes stocked.

REPAIRS.—We make a specialty of treating old and damaged cells. All repairs guaranteed. Send for new list.

Have YOU tried
the new Road-
clearer for bicycles?

TAMBOURONG

Replaces the old-fashioned bell and horn.
The Effect is Startling!

Fixes on front forks. A cord from handle-bar pulls trigger when required in contact with front wheel spokes and sounds like a noisy drum or gong.

Stamped metal gong, 1/6.
LEO. RIPAULT & CO.,

64a, POLAND ST., LONDON, W.

Sole Agents for the genuine Parisian made article.

NOTICE. As we find the parchment model is detrimentally affected by damp weather we have abandoned this pattern in favour of the new stamped metal gong, which is the thing for Motor Cycles, and made specially strong.

WANTED.

WANTED, new or soiled 6 h.p. Jap, Chater, magneto, will give 1907 3½ h.p. Quadrant, perfect, and genuine Schweitzer violin, dated 1814, valued £20.—23, Wilton Road, Handsworth.

MOTOR Cycle wanted, second-hand, 2½ to 3 h.p., Triumph or Quadrant preferred; state price, and year of make; must be in good running order, and open to a trial.—J. London, 49, Bow Lane, London.

WANTED, high-grade motor cycle or car; exchange new high-class furniture, any description, valued wholesale, direct from works. — Furniture Manufacturer, 9, French Place, Shoreditch, London.

WANTED, good 3½ h.p. Motor Cycle, magneto, 1908, in exchange for 18 carat gold keyless English lever watch and diamond ring, three stones, cash adjustment.—Richards, 22, Rosemont Road, Acton, W.

WANTED, first-class motor cycle, or tricar and little cash; exchange for 10-12 h.p. two-cylinder four-seated car, well-known make, in excellent condition; trial given.—Percy Wilson, 51, Park Grove, Leytonstone.

WANTED, 5 or 6 h.p. Singer, Riley, or Humber tricar, exchange two-seated Pelham car, 6 h.p. De Dion engine, three speeds and reverse, little used, perfect condition.—Carlsruhe, Dickenson Road, Crouch Hill, London, N.

WANTED, 1907 or 1908 Vindec, Triumphs, Bats, Phelon-Moores, Minervas, Rexes, Nortons, F.N.'s, Moto-Reves, Rocs, etc., for spot cash, or for exchanges, or, if preferred, we will sell on commission.—Maude's Motor Mart, Powell Street, Halifax. Nat. Tel., 433.

WANTED, Brazing Forge, lathe, 5in. staple vice and tools, suitable motor work, will exchange 2 h.p. Minerva motor cycle, good order, 2 h.p. A.V. engine and coil, carburetter, and fretwork machine. — A. Middleton, c/o Friars Croft, Wymondham, Norfolk.

S. J. FAIR, The Motor Cycle Exchange, Cheltenham Road, Bristol.—Wanted, 25 second-hand motor cycles, any makes, 1½ to 6 h.p., for shipment abroad; motor cycles sold on commission, or purchased outright; cash remitted by return: hankers' references if desired.

WANTED, two motor cycles, about 2½ h.p., if requiring repairs not objected to: also one motor cycle, not less than 4½ h.p., must be in good condition, with two speeds, free engine, and magneto ignition. — Particulars and price to Fred. Heath, 1, North Cray Road, Bexley, Kent.

WANTED, genuine up-to-date motor cycle, 3½ h.p. Triumph (1908) preferred; exchange 12 bore hammerless ejector gun and case, by Powell, Birmingham, has been little used, cost £34, and a little cash for a genuine machine. — Bate, 46, Havelock Road, Handsworth, Birmingham.

BOOTH.—Fuller accumulators, 20 amp., 17s.; Rex type, 16s.; Minerva, 16s.; Midget, 16s.

BOOTH.—5s. 6d. allowed for your old accumulator in part payment for Fuller's.

BOOTH.—50 pairs XI'all spring forks; immediate delivery; N.A.B. seat-pillar, 3s. 6d.

BOOTH.—Long motor cycle handle-bars, heavy gauge, best quality plating; 5s. 6d.

BOOTH.—Silent silencers, for engines to 5 h.p., very efficient, no back pressure; 3s. 3d.

BOOTH.—Frames, £1 5s.; wheels, 9s. 6d. pair; plain coils, 2s. 11d.; trembler coils, 5s. 6d.

BOOTH.—Send for list of oddments, speed gears, tanks, etc.; clearance bargains.

BOOTH.—Camel rubber belting, tremendous stock; 3in., 9d.; 3in., 1s.; 3in., 1s. 2d.; 1in., 1s. 5d.; samples free

BOOTH.—Coronet Searchlights, minor lenses, with generator; 22s. 6d.; approval.—Booth's Motories, Wade Street, Halifax.

BOOTS, box calf, any size, and four fittings; 8s. 6d., post free, worth 12s.; satisfaction guaranteed.—Frank Asher, Desborough.

GENUINE Minerva Frame, brand new, vertical, enamelled black, with front forks and tank, 50s.; Sphinx spring seat-pillar, 3s. 6d.—7, Dyers Hall Road, Leytonstone.

TRICAR, 5 h.p. twin Kerry, 2 1/2in. Continentals, 1in. belt, wing guards, rubbered footboards, splendid condition; £18, or would entertain exchange and cash.—111, Lilford Road, Camberwell.

KORONA Motor Belt, 8ft. 6in. long, 3in. wide, never been used, 6s. 6d.; Michelin tyres, new, 26 by 2 1/2, never used, accept 18s.; also tube, new, 6s. 6d.—Springfield House, Churchgate, Stockport.

BUCKET Seat, 10s.; spring forks, 6s.; one pair B.E. Silvertown tyres, 15s.; two belt rims, 2s. each; twin Kerry carburetter, 12s.; and Mabon clutch, 3in., wants completing, 12s. 6d.—111, Lilford Road, Camberwell.

CASH or Instalments.—New and second-hand engines, 2 1/2 to 8 h.p., air or w.c., exchanged for old of less power; specialite—De Dion, M.M.C., Excelsior repairs and renewals; 2 1/2 h.p. made to give 3 1/2 h.p.; 11 years' motor experience.—The Record Motor Co., Coventry.

MATCHLESS Footrest Brake, No. 2, 15s.; Gillett-Lehmann controller for twin Rex, 20s.; Vim rear brake, 4s. 9d.; motor cycle frame, wheels, and tank, for inclined engine, 30s.; new accumulator, 7s. 6d.; motor cycle stand, 4s. 3d.; car radiator, 36s.; piano player and tunes, 25s.—Halifax Motor Exchange, Westgate, Halifax.

TRADE Direct and Save a Profit. — The Albany waterproof jackets, from double texture paramatta, at 18s. 6d., are going well, but for winter riding you may prefer our 21s. jacket, made from best plain fawn proof, lined self beaverteen; this is a heavy, warm, tailor made jacket, with latest improvements; any size sent carriage paid; cash with order.—G. Raws and Sons, Indiarubber Manufacturers, Oldhall Street, Liverpool.

YOU Walk Sometimes, and want an Albany macintosh coat, guaranteed absolutely wind and waterproof, Prussian collar, with attached flap; loose fitting wide skirts, in best quality double texture paramatta, tailor made to measure, in latest shade of fawn drab, new grey green, also in a beautiful brown shade; send length desired and chest measure; only 21s.; winter weight, 25s., cash with order; we pay carriage.—G. Raws and Sons, Indiarubber Manufacturers, 15, The Albany, Oldhall Street, Liverpool.

MISCELLANEOUS.

PHENIX Gear, full size, built in 26 by 24 wheel; sell £3, or exchange.—Geary, Newtown Linford, Leicester.

BARKER'S Iron Cement for cracked cylinders, etc.; 1s. tin.—Oxford Road, Worthing.

CASH Offers.—Pulco lamp and generator, cost 28s. 6d.; F.N. carburetter and horn.—J. Robinson, Holly Bank, Sale, Manchester.

FOR Sale, Manning Tricycle Attachment, to fit four-cylinder F.N., perfect, run 100 miles; £7.—Thornhill, "Limes," Halesworth.

CHATER-LEA Tricar Axle, wheels, expanding brakes, steering column, 35s.; Young's car jack, 6s.—Hart, 31, Vanguard Street, Deptford.

LARRAD'S Motor Timer, new condition, 17s. 6d.; Longuemare carburetter, B26, perfect, 30s.; Whittle belt, 3in., nearly new, 12s.—73, Church Street, Camberwell.

TANKS, torpedo or any shape, from 4s. 6d., in brass lead coated steel, etc., combined tank and radiators, for tricars; repairs and alterations.—Winder, 54, Ganton View, Leeds.

FRAMES made to order, £2 10s.; Osborne four-speed, complete with handle, £2. fit Kerry; forecar frame, £1 5s.; Chater sidecar, £4 5s.; Crossley gas engine, 4 h.p., £15.—Millard, Belvedere.

APPROVAL.—Longuemare Model H. Carburetter, brand new, 18s. 6d.; R.O.M. twin contact breaker, fit Peugeot, 22s. 6d.; plated torpedo tank, 10s. 6d.—Smith, Ford Street, St. Mary, Nottingham.

PULCO (original) Lens-mirror Searchlight, with special large burner, 17s. 6d., cost 24s., new August; generator, 7s. 6d., cost 16s. 8d.; cigarette case, new, 3s., cost 6s.—1, 169, The Motor Cycle Offices, Coventry.

NEW Michelin Cover, 28 by 24, 16s. 6d.; Nil-nielor trembler coil, perfect, 8s. 6d.; 10 a.h. accumulator, 5s.; Acetyphote, 5s.; pair Chater-Lea rims, 28 by 2, beaded, 2s. 6d.—27, Cambridge Road, Barking.

BARGAINS.—28 by 24 Clincher cover, 5s. 6d.; 26 by 24 unpunctured Dunlop tube, 6s.; front forks, new, 26in., 8s.; Rex blade and screw, new, 4s.; 3in. belt, 3s. 6d.—1a, Frideswide Place, Kentish Town.

SWAN-NECK Saddle Pins, 2s. 6d.; long handle-bars, 4s.; torpedo and ordinary tanks from 5s.; frames from 50s.; anything to specification; lowest price; workmanship guaranteed.—Arrow Motor Works, Victoria Road, Peckham.

BRAND New Gianoli twin plain coil, 10s.; Minerva 15 amp. accumulator, new, 7s. 6d.; Norman two-speed gear and fittings, £2, unused; large acetylene lamp, 5s.; 26in. back wheel, with belt rim, new, 5s.—73, Lorrimer Road, Walworth.

MICHELIN Inner Tube, 26 by 24, endless, good condition, 7s. 6d.; Michelin tube, 26 by 24, butt-ended, new, not used, 9s. 6d.; Basse-Michel coil, plain, special size, oblong, perfect condition, 9s. 6d.—73, Church Street, Camberwell.

NEW 3 h.p. Motor Cycle, low, £8 10s.; twin Carpentier coil, working order, 9s.; Chater-Lea front forks and wheel, 8s.; Werner coil, 4s.; 60 amp. Dinin accumulator and box, 6s.; 28 by 2 front wheel, 3s. 6d.; four good 26 by 24 tubes, 2s. 6d. each; bench drilling machine, 15s.—Lisles, 15, St. Mary Road, Walthamstow.

IMPORTANT.—Quantity new and second-hand frames, tyres, coils, accumulators, magnetos, belt rims, lamps, accessories of all kinds, also quantity engines and motor cycles, various makes. Will cost 1/2d. to state your wants, may save you pounds. We also have a special department for repair and experimental work of all kinds, including repairs to castings and forgings by oxy-acetylene welding. Prompt attention given to all orders, however small. Write for lists and particulars of the above, and also of the Fairy Amac carburetter, and Fairy accessible battery, both good things. When you know your want, you want to know us. It will pay you to.—The Fairy Motor Co., Fairy Works, Westcombe Hill, Blackheath, S.E.

C. A. V.

ACCUMULATORS.

We claim—facts fully justify it—to be by far the largest manufacturers of Ignition Accumulators in the United Kingdom, producing their components throughout. We already supply most of the leading firms in the Motor Industry—then why not you? Once used, they are always used! We hold over a thousand testimonials!

MORE ABOUT TRICARS.

By B. H. DAVIES.

TWO very important letters published in the "Letters to the Editor" pages supply me with the text for a further discourse upon the tricar question. One of these letters, signed "Tri-again" (page 794, October 7th), referred to a rear sprung tricar, and in it the writer states the rear part of his machine was so whippy that on a highly cambered road the twist and swing of the rear frame pulled the whole machine over two or three times, and that although there was no deflation of the rear tyre. On page 895 (issue of October 14th) Dr. Gaskell rather laughs at me for asserting that a tyre burst on a rear sprung tricar necessitates a smash. I would refer him first of all to "Tri-again's" experience; then I would remind him that he has never had a tyre burst on one of these machines. I have had this experience six times in all at varying speeds and under varying circumstances with two tricars of different best makes. Only in one case was I able to come to a standstill in the vertical plane, and that was when the burst occurred at a very low speed on a broad, flat road. On the other occasions the burst has occurred at speeds ranging from twelve to thirty miles an hour, and in each case I have either upset or gone into the ditch, and I venture to say any driver in the kingdom would have been equally helpless. Dr. Gaskell's experience of a tyre commencing to deflate at thirty miles per hour and taking a hundred yards to go flat is perfectly safe, though unpleasant.

The Method of Springing.

Dr. Gaskell next asserts that rear springs are essential to the comfort of the driver and to the life

and reliability of the mechanism. I differ from him, because I know two tricars destitute of rear springing which are quite as comfortable as rear sprung machines, and which save the machinery from vibration quite as efficiently. One of these is the 9 h.p. Advance, which I have often driven this year and last. It has elliptical and Cee springs in front, but its rear frame is the ordinary triangulated fork system standard upon bicycles. The front springing, unaided, proves in practice quite equal to safeguarding the mechanism. The driver sits in a bucket seat carried on two long steel pillars; these pillars rest in barrels containing coiled springs, and I defy anyone driving this machine to distinguish any difference in comfort between this system and the rear elliptical spring system in vogue on such tricars as the 9 h.p. Riley, which I have driven thousands of miles. My other instance is the Zenith tricar, with the frame sprung and hinged amidships. This tricar is even more comfortable than the standard rear springing, though I have only a very limited experience of it. Again, I have had sudden tyre deflations on several rigid rear framed machines, and that at high speeds, and I have always found they are much safer and more easily brought to a standstill in a direct path under these circumstances than the ordinary motor bicycle. Consequently I have no doubt that a tricar may be evolved which shall be absolutely safe when the back tyre collapses at any speed, and which shall not sacrifice efficiency of springing in the very least, but even show a marked improvement in this respect. This means that the front only of the tricar frame and the driver's seat shall be sprung.

More About Tricars.—

Further, I wish to remind Dr. Gaskell that he is asking for a great deal more than any manufacturer can give him at his price. We can hardly hope at present to get three speeds and reverse on a £60 machine, and if we ever get them on an £80 machine we must sacrifice some refinement which is far more necessary. I do not think there is any gear box of this pattern on the market at a penny under £15, while many cost considerably more. Facts prove that with the cheapening of the small car the expensive tricar has lost its future. In fact, when a decent little second-hand car can be easily bought for £80, it is doubtful whether £80 is not more than people will pay for a tricar. I think we may take the Rex Litette as the basis of what we may expect in the tricar line, and, except that it has a belt drive, it answers very closely indeed to the general idea of what a light tricar must be to have any commercial prospect to-day. No one can make or sell motor cycles more cheaply than the Rex Co. In the Litette we have their idea of a 1908 tricar, technically and commercially practicable. It has a 5-6 h.p. thermo-cooled engine, frame sprung in front, rigid behind, with separately insulated driving seat, magneto ignition, and two-speed gear; but with their huge facilities and experience it has to be listed at nearly £80! If we examine it with an eye to cheapening it, we can find

nothing that can possibly be parted with, except conceivably one cylinder and the water-cooling.

The 1905 Type Redivivus.

When a new two-seated car can be had for a trifle over £100, and a sound second-hand sample at from £60 to £90, it is no use marketing the most magnificent tricar imaginable at a higher price than £90, and it is distinctly possible that any great future demand for tricars will be limited to a still lower figure. We have to make up our minds to accept a simple specification, and any clamour for three speeds and reverse, expensive coach-built bodies, with a multitude of detail refinements on car lines, is a sheer waste of time. But the advent of cheap and good two-seated cars still leaves a gap, and that gap may be filled by such a machine as the Editor referred to on September 2nd, and on which I enlarged on September 23rd. It will really be the 1905 type redivivus. There must be a huge addition of comfort. A huge addition of reliability will be instantly attained by incorporating the features which the intervening years have added to the motor bicycle, especially the magneto. And I hope that next year will see the advent of a little fleet of such machines, on which passenger motor cyclists will enjoy the more sociable aspects of their sport in peace, cheapness, and comfort.

A POWERFUL PACING MACHINE.

ALTHOUGH the pacing motor bicycle illustrated is not of such high power as some of the huge Continental machines, it is quite fast enough for use on English tracks, and can set the pace for the speediest cyclist. The owner, W. Skuse, who is mounted on the machine, is an expert rider, and has trailed Leon Meredith in all his races and records during the past few seasons. The machine follows closely the Continental design of pacing motor cycle, with sweeping handle-bars, and stays connecting with the front axle, the forks being strengthened by substantial girders. The safety fender at the rear is fitted with a roller, a white mark in the centre serving as guide for the pace follower. The controlling levers and lubricating pump are placed within easy reach, while the rearward position of the rider affords the utmost shelter to the pace-following cyclist; in fact, the design of the machine is practically a Continental pacing motor in miniature. The bicycle was constructed by Fossier, the well-known French pacer, and the V engine is by Anzani, who enjoys a high reputation abroad for engines for this class of work, the two Frenchmen, indeed, being once notable speed motor cyclists, especially Anzani. The cylinders are 80 mm. x 90 mm., and a Longuemare carburetter is fitted. Ignition is by coil and accumulator. The wheels are 26in., and the tyres Continental Modèle de Course of 2½in. diameter. The gear

ratio is 3 to 1, while the machine scales 140 lbs. With the exception of a rear tyre bursting and bringing the rider down, since which mishap he has taken the precaution to equip the wheels with stronger tyres, Skuse

W. Skuse, pacing motor cyclist to Leon Meredith.

has experienced little or no trouble with the machine.

We are in receipt of an interesting booklet published by Hans Renold, Ltd., Manchester, entitled "Renold Driving Chains and Their Use." The book describes

in detail every form of Hans Renold chain made, and to those interested in chain transmission it should prove to be of considerable service.

1909 Improvements.

THE Stanley Show, which opens on Friday next and closes on Saturday week, will be full of interesting motor cycles and accessories. In accordance with previous years, we have prepared plans of the exhibition by courtesy of the Stanley Show secretary, Mr. E. A. Lamb. These plans will be found on pages 896 and 897, and with their aid motor cyclists will be able to find all the motor cycle stands on the floor of the hall and in the galleries.

The various manufacturers of motor cycles and accessories have supplied us with advance particulars of their 1909 improvements, and in some instances we have been able to obtain a private peep at the new models.

This issue of *The Motor Cycle* being published two days before the opening of the exhibition enables us to give our readers a few particulars of novelties to look for on the various stands, but we do not publish the stand numbers in this article, as they are all given on the plans. As the motor cycle approaches nearer and nearer to perfection it is only natural that the improvements on up-to-date makes are more in the nature of detail advancement than drastic alterations of design. Nevertheless, there will be found several entirely new models, some of them being extremely novel, and one or two may even be said to be revolutionary. We cannot conclude these few introductory remarks without heartily welcoming the large and long established firms of Humber, James, and Premier to the ranks of motor cycle makers. The Humber motor cycles were sold in large numbers five or six years ago. As the new models possess several most attractive features, they will doubtless soon regain their share of popularity. The James Cycle Co., we believe, have not made motor cycles since the days of strengthened pedal bicycles fitted with Minerva engine sets. Their model is of a very novel type, but of this further details are given on subsequent pages. The Premier Cycle Co. enter the arena for the first time as motor cycle makers. They have an attractive model fitted with a well-known tried engine, the White and Poppe, and should do good business with it.

THE COMPLETE MACHINES.

A 7-9 h.p. (85 by 95 mm., two ignitions) Bat combined motor bicycle and sidecar, with three-speed sliding gear, chain drive, and differential, will be shown by the Bat Motor Mfg. Co. All the transmission mechanism is on the sidecar, which, having two wheels, makes up into a complete four-wheeled vehicle. Both front wheels are provided with the Bat spring forks. The sidecar seat is hinged below the footboard, while its rear portion is hung on coil springs. The clutch and driving-shaft are coupled direct to the engine pulley, and a belt rim is also

provided. The bicycle axle, which runs on Hoffmann ball bearings, is of the live type and hollow, and receives the sidecar axle, so that by uncoupling the steering, the sidecar connections, and the rear axle, a single geared motor bicycle is obtained. The whole design is extremely ingenious, and the machine has, moreover, been thoroughly tested on the road. A motor bicycle twin 8 h.p., 85 by 85 mm., mechanically operated valves on the side of the engine, Phelon and Moore gear. The gear is carried on a countershaft, to which the power is transmitted by means of chains, and thence to the rear wheel by belt. A 2½ h.p. 70 by 76 mm. lightweight, with gear-driven magneto. Two twin Tourist Trophy models—one mechanically operated valves of overhead system, 85 by 76 mm., the other automatically operated inlet valves, 76 by 95 mm. Several other twin and single-cylinder models. All machines will be fitted with Bosch magneto ignition, handle-bar control, J.A.P. or Amac carburetters, and Continental tyres (non-skid type). J.A.P. engines will be used in all cases; of these the two new models are the 2½ h.p. automatically operated inlet valves and the 3½-4 h.p., 85 by 85 mm., with side by side mechanically operated valves.

The Brown machines are practically unaltered. The 3½ h.p. and 5 h.p. models will be continued, with the addition of the B. and B. handle-bar controlled carburetter, rubber shod footrests, adjustable pulley, Druid spring forks, and pedal operated belt rim brake.

One firm which will make a 3½ h.p. motor bicycle its standard pattern is Bradbury and Co., Ltd. Whilst retaining the special features in engine and frame construction for which the Bradbury has been noted for five years, the new pattern will have several detail improvements: The main engine-shaft will be fitted with ball bearings; a longer wheelbase and a lower frame will be supplied; an improved tank and silencer, and the Bosch magneto ignition fitted as standard.

One of the many attractions will be a 6 h.p. twin-cylinder Chater Lea motor bicycle designed primarily for use with a sidecar. Fitted with magneto ignition, chain transmission, a nine-inch leather to metal friction clutch, and a two-speed Chater Lea gear box, it should meet with a ready demand even for solo work among the more experienced. Of good design and manufactured of material of irreproachable quality, it might almost be said that it starts its career with a

Brown adjustable engine pulley, which will be fitted to '09 single and twin-cylinder models.

1909 Improvements.—

ready-made reputation. The Chater Lea Mfg. Co., Ltd., have also improved the Carette. This will have chain transmission, three speeds, back hubs

Chater Lea twin-cylinder, two speed, chain-driven bicycle, particularly suited for sidecar work.

stronger, with internal expanding brakes. The sidecar will have the spring suspended wheel recently illustrated in these pages and new easily detachable joints. A new pattern light-weight motor cycle with J.A.P. engine, a new and well-designed pedal operated rim brake, and the spring magneto terminals will also be exhibited.

The Matchless machines, particularly after C. R. Collier's famous record ride at Brooklands on October 8th (70 miles 105 yards in the hour), will be examined with interest. The improvements consist of a newly designed spring fork, Ruthardt or Bosch magnetos as standard, and handle-bar controlled Amac carburetters.

A New Lightweight.

The Corah $2\frac{1}{2}$ h.p. lightweight is a new model, which will in all probability be exhibited on the stand of the Service Co. It will have a Ruthardt high-tension magneto, mounted on the crank case at the rear of the engine, and driven by a train of gears in a dustproof case, also Brown and Barlow's handle-bar controlled carburetter. The frame will be built low, with strong back carrier, and stand built up with the chain stays. Wheelbase, 48in.; height

A new lightweight F.N. of $2\frac{1}{2}$ h.p., with two-speed gear and bevel drive.

of top tube from ground, 28in. Number plate attached to rear of carrier. The Druid girder spring forks will be fitted, and 26in. by 2in. Continental tyres. The weight of this machine will be 100 to 110 lbs.

Among others who will show new models are Douglas Bros., who have a new Model B, in which the following improvements have been made: The engine has been lowered 4in. in the frame, and a newly-designed carburetter fitted, with throttle so arranged that the mixture of gas and air is of the same proportion when nearly throttled as when full gas is being used. The control is entirely from handle-bar, by means of throttle, air, and exhaust lifts. The frame is lower, and has a longer wheelbase. Motor cyclists and prospective riders should examine this machine, fitted with neat and efficient stands for the back and front wheels, a light and strong carrier, convenient and adjustable footrests and number plates complete ready for the road. The engine, having proved reliable in all the trials, has not been altered, except that neater silencers have been substituted.

The Motosacoche 1909 improvements will be longer and lower frame magneto model, engine 3in.

The new model single-cylinder Motosacoche, with lower frame and magneto ignition.

nearer ground. Easy starting is assured by an alteration to the magneto transmission. The tyres will be of the light motor cycle type to all models. The magneto model will be fitted with petrol and oil gauges, three handle-bar levers, throttle, spark, and exhaust lifter. The magneto will be easily detachable, and can be replaced without altering the timing. A working sectional model of the Motosacoche will be on view at the company's stand.

The new introduction at the F.N. stand will be a single-cylinder $2\frac{1}{4}$ h.p. lightweight model, with special new refinements in the way of a two-speed gear, handle-bar control, pedal brakes, etc. The gear box has sliding gears giving in conjunction with the bevel gear drive ratios of 6 and 10 to 1. The lubrication of the engine is by drip feed, and in addition a force pump is provided to give an extra amount of oil should it be required. With $2\frac{1}{4}$ in. tyres, stand, and carrier, the weight will not exceed 120 lbs. The 5-6 h.p. four-cylinder F.N., which has had such a successful year, will, of course, be on exhibition.

1909 Improvements.—

An Entirely New Design.

The novelty of the show as far as motor bicycles are concerned will be the James, made by the James Cycle Co. The frame of this machine is of special construction, with tubes all on one side of the two wheels. The saddle is suspended on special flat springs, which are attached to the socket tube on the front portion of the frame and to a lug perpendicularly situated below the saddle. The movement of the flat springs is further controlled by coil springs. Short laminated springs are fitted to the front wheel axle. The steering is a patented device, the steering pin being carried in the centre of the hub, the latter revolving over the pin on large diameter ball races. The back wheel hub is

The James Motor Bicycle which will make its debut at the Stanley Show.

similarly constructed, and has a live axle, the belt rim being built up on a separate hub attached to the live axle, and running outside the frame tubes. Both hubs contain internal expanding metal to metal brakes. The engine in the above illustration is not the one which will be fitted to the James motor cycle. The new engine has several special features, among which may be mentioned a control by means of a variable lift of the inlet valve, concentric exhaust and inlet valves, the exhaust being the outer one. This dispenses with one of the usual cam wheels, both inlet and exhaust valves being operated by one cam wheel fitted with a double cam for the exhaust valve and a single central cam for the

inlet valve. Both inlet and exhaust valves are opened by rocking levers, and by a clever arrangement the rocking lever of the inlet valve can be moved further from or nearer to its fulcrum, so causing the inlet valve to lift more or less. The bore of the engine is 86 mm. and the stroke 90 mm. The engine is provided with ball bearings to all the shafts except the gudgeon pin. The ball bearing on the connecting rod big end is particularly large. The one on the timing gearshaft differs from the Hoffmann type, as it has a cup and adjustable cone on the lines of the bearing used on pedal bicycles. The arrangement of the radiating fins is quite a new departure. The fins are cast square and staggered in addition, so that the points of the radiators are exposed more fully to the air and the space provided between the radiators causes a better circulation, as one radiator does not shroud the other. The petrol tank, which is carried in front of the steering head and serves also as a mudguard, has a capacity for 150 miles, whilst the oil tank will hold sufficient lubricating oil for 250 miles. The magneto is situated behind the engine, and driven by a chain enclosed in a case. The engine pulley has a sliding loose flange which provides for a free engine. When fully expanded the belt drops on to a ball bearing. The pulley can, of course, be operated whilst the rider is seated on the machine, so enabling a start to be made without running alongside. The procedure is to start by a handle from the live axle on the back wheel, whilst the machine is jacked up on the neat stand which will be provided. To start, the pulley flange is closed until a low gear of about 6 to 1 is reached. The engine is then started and the pulley flange expanded until the belt drops on to the free engine pulley bearing. The stand is now raised (this is done automatically, the stand being controlled by a spring), the rider then seats himself, and by closing the flange of the expanding pulley the machine is started. The control of the carburetter and ignition is from the handle-bar. Pedals are used to operate the brakes and the sliding flange on the pulley. In addition to the carburetter handle-bar control, a lever is provided to vary the lift of the inlet valve. This should be an ideal

Plan and elevation of the new James Motor Bicycle frame. It will be noticed that all the frame tubes are situated on one side of the wheels.

1909 Improvements.—

control. A tubular luggage carrier is fitted over the back wheel with a tool case on the top. The transmission is by rubber and canvas belt. As will be gathered the James machine possesses many novel features, but it is impossible for us to state its capabilities until we have had a practical riding experience of one of the new models, which at the time we inspected the various parts were not ready for use. The model illustrated, however, has been in use for some time, and the manager of the company, Mr. Arter, assures us that he has driven it seven or eight hundred miles with perfect satisfaction.

The New Humber Motor Bicycle.

The $3\frac{1}{2}$ h.p. Humber motor cycle is an entirely new design with low frame ($28\frac{1}{2}$ in. from ground). The engine has a bore of 83 mm. and a stroke of 90 mm., with ball bearings to engine-shaft and big

bearing which runs around the tubular crown. From the crown extend two arms fore and aft, and from the arms coil springs extend to the fork blades. Provision is made for the possibility of a broken spring by a catch on the ball race, which in the event of breakage would only allow the fork blades to swing outwards to a limited extent, when their further progress would be arrested by the catch. The silencer forms part of the front down tube of the frame, and has a capacity ten times that of the combustion chamber, thereby allowing ample space for the expansion of the gases without noise. Owing to the size of the silencer, the Humber motor bicycle should be a very quiet machine. It will be shown with and without a two-speed gear hub. This two-speed gear is operated by pedals on the left footboard; the pedals contract brake bands, which bring the high or low gears into operation as may be required. To obtain a free engine a catch liberates the high gear clutch. The

The $3\frac{1}{2}$ h.p. Humber Motor Bicycle with two-speed gear, handle starting, spring forks, and footboards. The handle-bars have a strut for attaching horn, watch, speedometer, etc., as shown in the inset.

end of connecting rod. Both valves are large in diameter and mechanically operated. The ignition is by Bosch high-tension magneto, gear driven. The carburetter is an Amac, with handle-bar control. The tank is in two parts, hinged at the front and grooved at the top to fit around the top tube; it has a capacity of about one gallon. The pulley has a loose adjustable flange, allowing gear ratios between 4 and 6 to 1 to be used. A tube connects the two ends of the handle-bars, passing from one side to the other; on this tube may be fitted a horn, watch, badge, or other articles. Accessories carried in this manner are conveniently situated for the rider, and when the machine is leaned against anything to support its weight the articles cannot become damaged. The sprung fork has the fork blades pivoted on a ball

hub has a live axle running in ball bearings at the ends of the rear stays. Numerous other special features are embodied in this design, with which we hope to deal in our show report.

A Two-stroke Twin-cylinder.

The standard $3\frac{1}{2}$ h.p. L.M.C. will remain much the same as before except that ball bearings will be fitted to the engine shaft without extra charge, and the position of the pedal will be carried forward to the left front footrest. The trial engine, which has run 20,000 miles, will be on view. An altogether new model is a two-stroke twin-cylinder motor bicycle; this weighs 105 lbs. with stand, and equipped with 2 in. by $1\frac{3}{4}$ in. Clincher motor cycle tyres. The two-stroke engine has cylinders side by side, and,

1909 Improvements.—

although they are cast without radiators, we are informed no signs of overheating have been apparent, and the machine has carried a ten-stone rider over such well-known hills as Birdlip, Rose, and Mucklow without pedalling. The automatically variable speed pulley, with and without free engine, recently described in these pages, will be shown, and altogether the L.M.C. stand will well repay a visit.

The Midget Bicans will be represented by three models, all fitted with magneto ignition and handle-bar control, and one with a two-speed gear. A patent adjustable pulley without threads or set-screws, and one that does not require the use of any tool to adjust it, will also be found on this stand.

Bosch magneto ignition is to be fitted to all Minerva models, viz., $2\frac{3}{4}$ and $3\frac{1}{2}$ h.p. singles and $4\frac{1}{2}$ h.p. twins, using the same type of magneto transmission

Minerva $3\frac{1}{2}$ h.p. model fitted up complete ready for the road.

as before. The carburetter is a G. and A. with auxiliary air inlet. A larger oil pump is fitted in a more inclined position. Back pedalling brake with larger and wider drum, and band brake operated by a pedal near the foot-rests. The throttle and ignition levers are fitted on the handle-bar, and each machine is provided with latest pattern Price's stand.

Stronger wheels, heavy 2in. tyres, and beaded-edge belt rims will be three features of the 1909 Moto-Rêve. The standard model has girder forks, the spring fork model special Druid spring forks. The frame is slightly lower and longer in the wheelbase. A pedal operated rear brake acts on the belt rim, and the tank has a larger capacity. The cylinders are embedded more deeply in the crank case, and an improved exhaust lifter, giving greater leverage, is provided. To render the engine more cleanly a special oil release valve is fitted on the side of the crank case.

A Novel Piston Ring.

Mr. Norton has decided to confine the Norton models to a $3\frac{1}{2}$ h.p. single-cylinder 82×90 mm. and a 5 h.p. twin cylinder 76×80 mm. Both these models are fitted with ball bearings to the mainshaft—in fact, they have been so fitted all the year, but only the twin cylinder was exhibited at the last show with what is becoming an almost universal feature. The pump is enclosed in the tank, and a special large saddle, registered design of stand, and belt rim brake

are provided. The latter is operated by a pedal moved by the heel when the feet are on the rests and by the toe when the feet are on the pedals, and a Norton-Druid spring fork is fitted. The cylinders are now removable without disturbing the crank case. Steel connecting rods are fitted to the engine working on hollow gudgeon and crank pins; this allows the lubricating oil to pass through the centres of the gudgeon and crank pins. The piston rings are constructed in a novel way which we do not remember having seen on any other motor cycle engine. They are of broad section, step cut, and provided with oil and gas retaining trap channels. The piston is similarly turned below the rings with several of these oil retaining channels. They certainly should enable a better compression to be obtained and maintained, and also assist in the lubrication. Other improvements are a registered stand, mainshafts shrunk into flywheels, crank pins squared into flywheels, and handle-bar controlled carburetter.

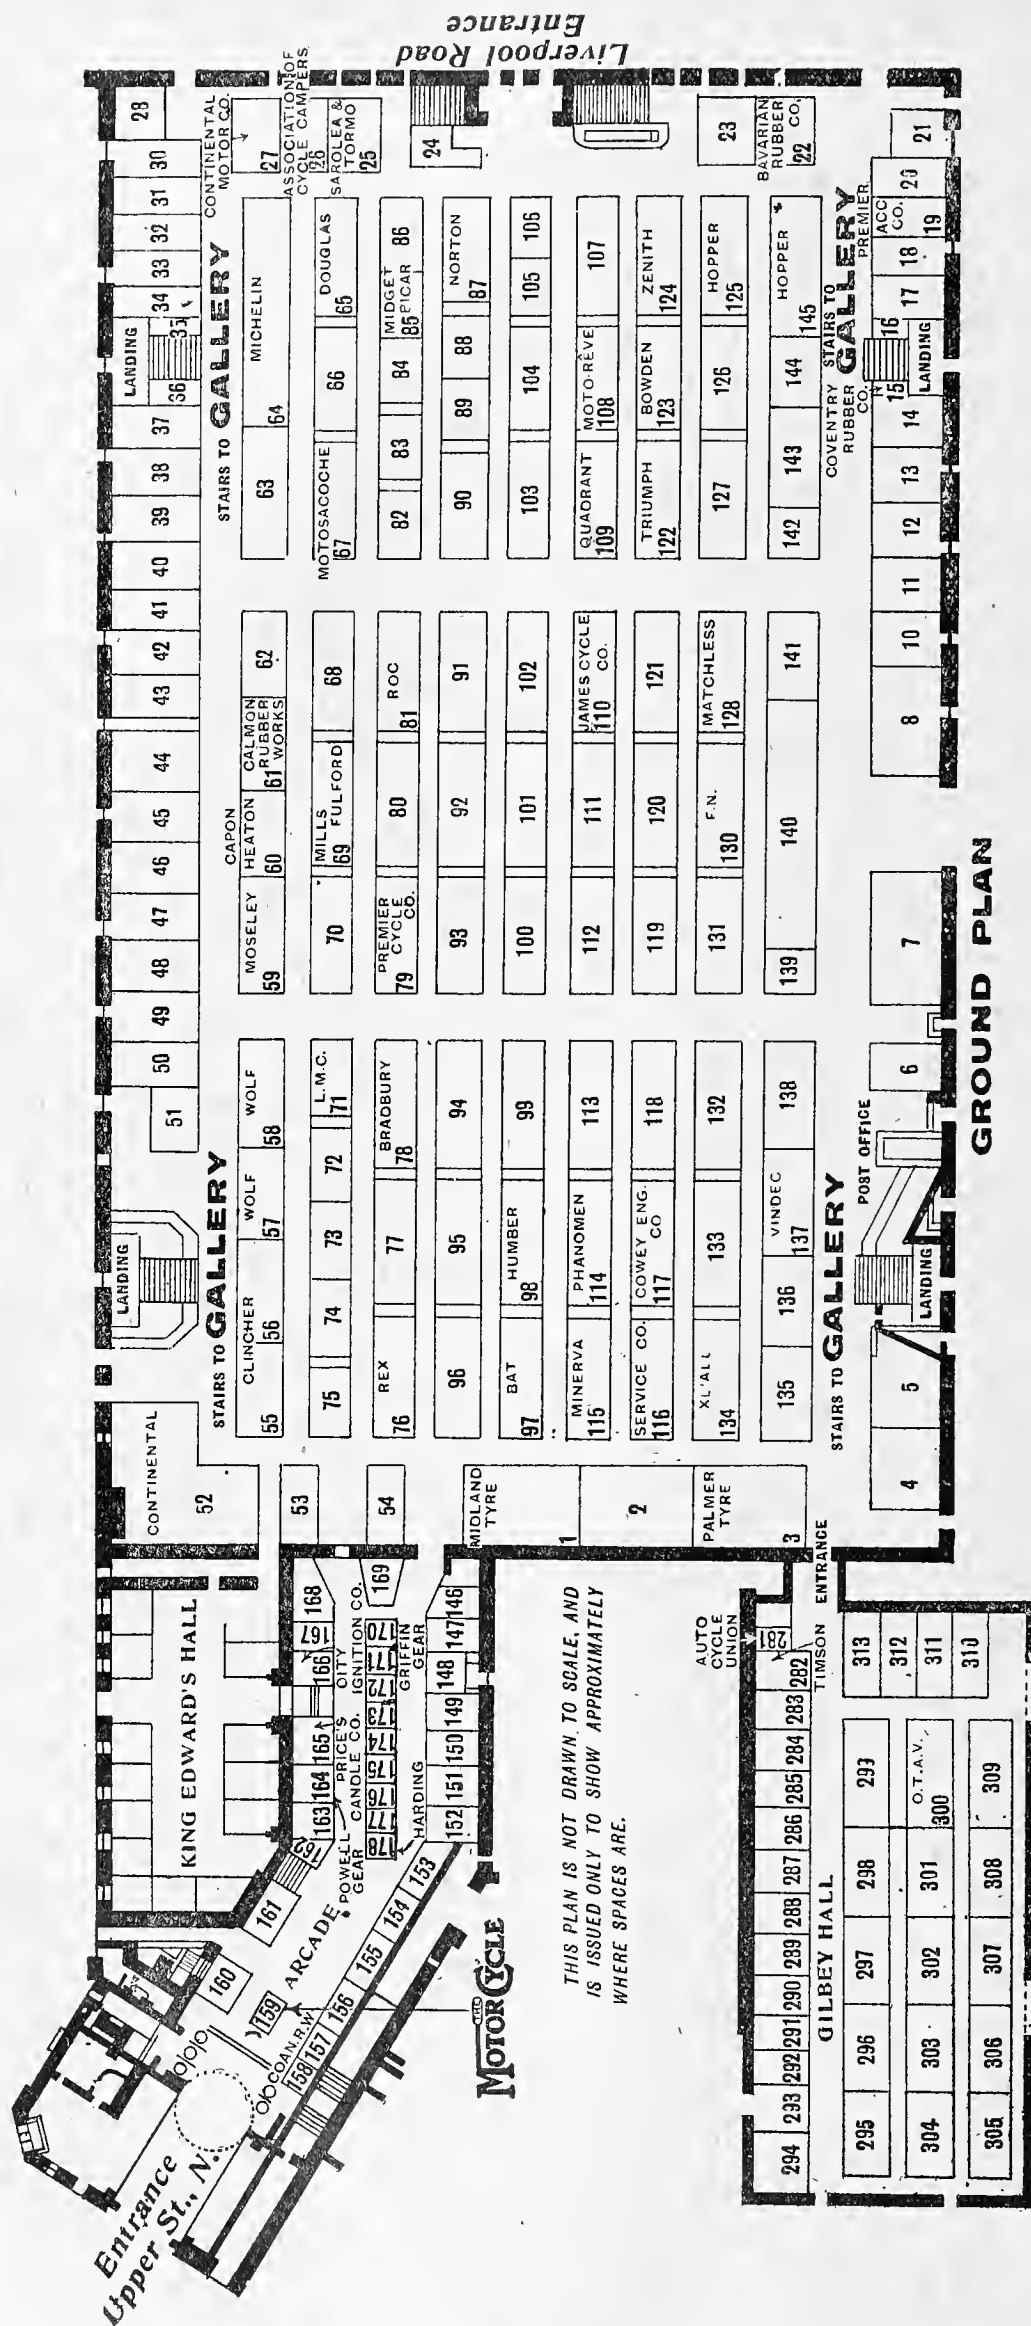

The 1909 models of the N.S.U. Co. will be more complete, fitted with a stand allowing the back wheel to be withdrawn, luggage carrier, number plates, rear mud-guard hinged to allow easy access to the back tyre, and footrests, with brake pedal easily accessible. The tank is arranged so that the exhaust valve can be easily extracted. Spring forks of the new improved plunger type will be fitted to all types. For 1909 there is a totally new 4 h.p. touring model, 82 by 105 mm., ball bearing engine, fitted so that if anything goes wrong with the ball bearings the journals can be arranged to run on the plain bearings provided. The rear brake will be of the internal expanding type. Handle-bar control, rin. belt, two-speed gear in hub, started by the pedals, main reduction in gear, allowing of only $1\frac{1}{2}$ to 1 ratio between the engine and rear pulleys. A new lightweight model weighing 100 lbs., with twin engine, 52 by 74 mm., mechanically operated valves, and handle-bar control. A 6 h.p. twin, mechanically operated valves, also with change speed hub gear, fitted to a new sidecar, which allows the back wheel of the cycle to be detached easily. The old pattern engine pulley two-speed gear has been

A Twin N.S.U. with mechanically-operated valves. The tyres are fitted with N.S.U. anti-skidding bands.

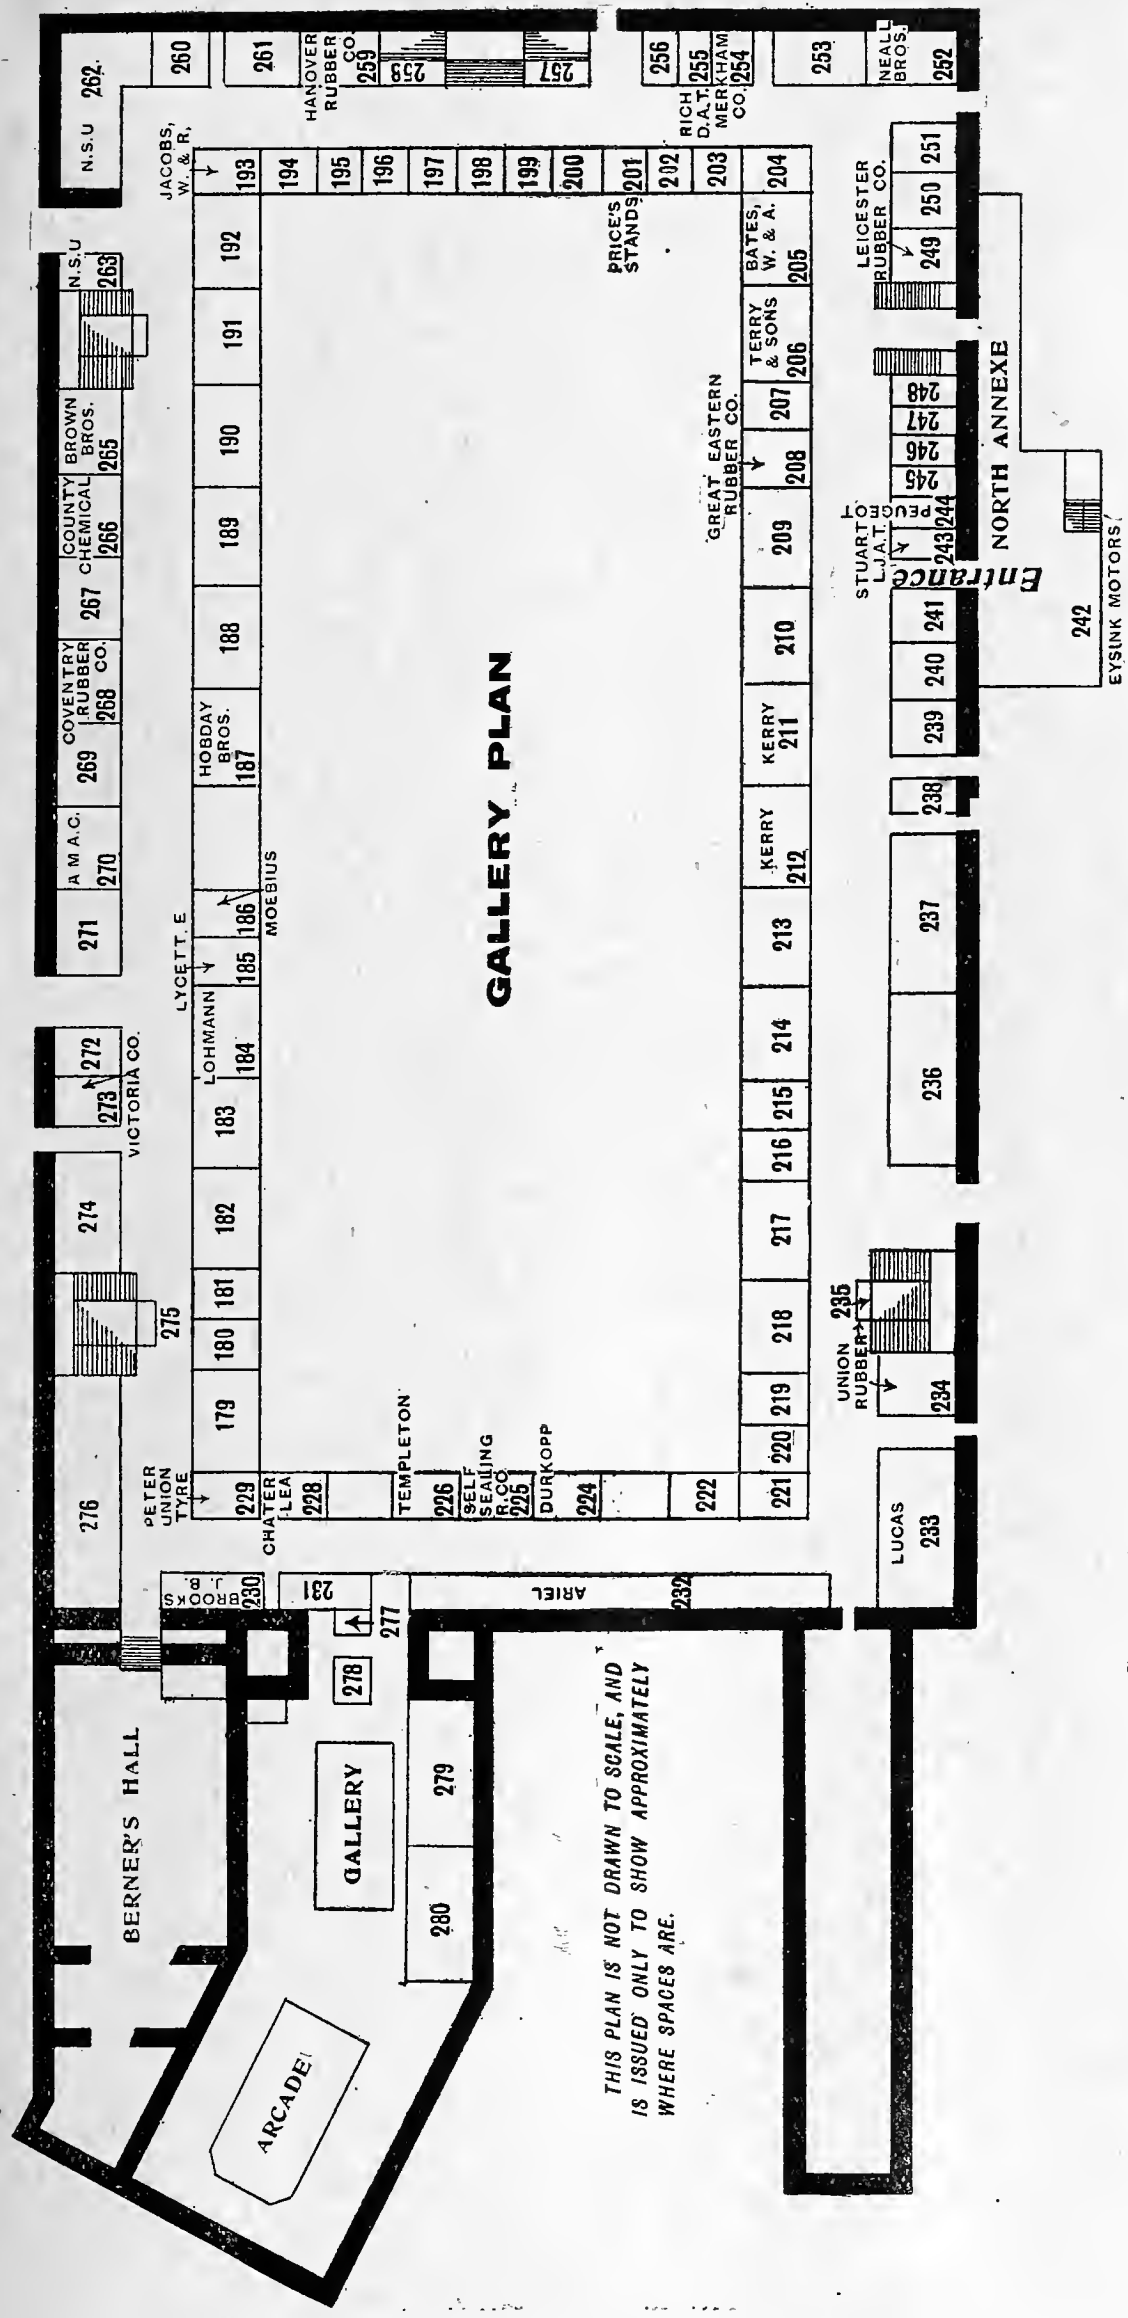

improved, and these improvements can easily be embodied in earlier models. There will also be a new 8 h.p. twin racer, cylinders 80 by 100 mm.

(Continued on page 898.)

THIS PLAN IS NOT DRAWN TO SCALE, AND IS ISSUED ONLY TO SHOW APPROXIMATELY WHERE SPACES ARE.

For FULLY ILLUSTRATED DESCRIPTION OF THE EXHIBITS, see Next Week's Issue.

1909 Improvements.—

The Phänomen exhibit will consist of a 4 h.p. single-cylinder machine with two-speed Nala gear, a 4 h.p. two-speed twin, a 6 h.p. two-speed twin with sidecar, and a 6 h.p. twin with two-speed gear, enamelled throughout in grey, even the pedals being of this colour. These machines can be started by the pedals in free engine position. The B. and B. car-

The Phänomen gudgeon pin fixing—*a* is the plug holding the pin in position; *d* a spoke for raising the plug to remove the pin.

burette, with handle-bar control, can be fitted without extra charge if desired.

The 1909 Quadrant engine was fully described and illustrated in the issue of November 4th. We understand there will be numerous improvements in the bicycle frame and other parts, which will be referred to in next week's full description of the exhibits.

Triumph Improvements.

Many important detail improvements have been made in the 1909 Triumph model, especially in the engine, by which more power is obtained and longer and more uniform wear of the cylinder is ensured. A slightly lower frame has been introduced, with other important improvements, which will appeal to and be appreciated by motor cyclists. No pedalling gear or carrier is being fitted to the T.T. models, and, in addition, the machine itself is lighter than the ordinary touring model, and is fitted with Dunlop wired-on tyres and racing handle-bars. The specifica-

The 1909 Tourist Trophy Triumph. A similar model was used by Capt. Sir R. K. Arbuthnot, Bart., R.N., and J. Marshall in the recent Isle of Man Race.

tion is the same as the ordinary touring model with the exceptions above mentioned, and that the engine has specially selected parts and a slightly higher compression. Among the chief improvements which have been made in the touring model are: A registered design of piston and a slightly lower frame; a new pattern Brooks saddle, which gives the rider a still

lower position; a new pattern front hub made absolutely waterproof; stronger cranks and stronger handle-bar; an improved lamp bracket and improved oil and petrol cans; increased power in the foot brake; stronger back springs to the front forks; heavier spokes

Triumph petrol and lubricating oil tank. Note the generator brackets, also the petrol injector, which is "on" in the position shown, and "off" when pointing rearwards.

in the back wheel; an improved tank with a special tap to inject petrol through the compression tap (patent applied for); and a generator clip fixed to the tank in a convenient position.

A New Spring Fork.

Very few alterations will be made to the Roce machines for 1909. The duplex frame and tank will be retained. The engines will be 4 h.p., 83 by 90 mm.

Front and side view of the new pattern Roce spring fork.

and 5-6 h.p., twin-cylinder, 75 by 80 mm., with ball bearings to the big end of main shaft and one shaft of the timing gear, viz., the one that drives the magneto. The principal improvement is a new pattern spring fork on C springs (see illustration). The Roce gear remains unchanged with the exception of the bands which operate the brake drums. These bands instead of being lined with one piece of metal, will be fitted with gun-metal discs riveted at intervals along a steel band. These discs are fitted to enable the brake band to clear itself of mud and dust, and to prevent

1909 Improvements.—

chattering of the brake band, which was a complaint received by the makers from some purchasers during this year.

The New Rex Models.

The exhibit of the Rex Motor Mfg. Co. will be full of interest to motor cyclists this year, as probably no firm has made more improvements to their models for 1909 than the Rex Co. The lightweight model has been dropped, and there will be four distinct models of motor bicycles—the $3\frac{1}{2}$ h.p. single-cylinder 1909 Rex, the 5 h.p. 1909 twin-cylinder Rex (both these

1909 $3\frac{1}{2}$ h.p. Rex standard model with handle-bar controlled carburettor. The carrier supports also form the mudguard stays.

machines will be fitted with pedalling gear), the $3\frac{1}{2}$ h.p. single-cylinder de Luxe with two-speed gear, and the 5 h.p. twin-cylinder de Luxe with two-speed gear. In passenger machines a $3\frac{1}{2}$ h.p. Triette air-cooled engine, two-speed gear as described and illustrated in the last issue, and a similar model with a twin-cylinder air-cooled engine. The principal improvements are a new spring fork, a steel engine cradle with an extension forming the magneto platform. The back fork ends allow for easy detachment of the rear wheel. On the handle-bar are fitted inverted levers for exhaust lifter and rear brake, and on the de Luxe two-speed models a dummy belt rim is fitted to the wheel so that the pedal brake can act upon it in a similar manner to that of the ordinary models. The lubricating pump is inside the tank, and on the $3\frac{1}{2}$ h.p. models a pipe from the waste petrol tap is arranged to come over the compression tap to facilitate starting. The engine is considerably improved, the cylinder has exceptionally large radiators. The piston has a domed top with two rings, one at the top and one at the bottom, and a gudgeon pin with gradual taper which wedges it in the lugs on the piston. One cam works two rocking arms operating the valve tappets, and the chain for driving the magneto is entirely encased in an aluminium cover forming part of the crank chamber casting. All 1909 machines will be supplied complete with carrier, stand, and tool kit. The carrier is a very neat construction of round tubing on which the tool case is supported. It acts also as the rear mudguard stays. The stand is pivoted on the chain stays, and the rear wheel can be taken out without disturbing the stand

attachments. The method of operating the change speed gear on the de Luxe models has been fitted with an improved locking device, although the method of operation remains the same, viz., when the high gear is in use the low speed is automatically released.

Several well-known makes of motor cycles will be found on the Service Co.'s stand, notably the Phelon and Moore, L.M.C., Triumph, Zenette with Gradua gear, Phänomen with variable gear, four-cylinder F.N., Rex, and latest Castor wheel sidecar. A new valve-lifter will also be exhibited, suitable for any motor cycle engine.

The frame of the Phelon and Moore will be lower, bringing the top of saddle to within 3 in. of the ground. The ball head and forks have been considerably strengthened. The combustion head has been redesigned, giving a clean sweep for the exhaust gases. Improvements in fixing now enable the engine to be swung down and the cylinder and combustion head removed in less than twenty minutes. To ensure easy starting with the handle, this latter is now engaged on to the low gear instead of the engine-shaft. A new handle-bar operated throttle will be fitted, and the tank has been made larger, and fitted with oil and petrol gauges and needle valve. The toolbag will be fitted in an angle of the frame, and the starting handle clipped on outside the toolbag.

A new lightweight two-stroke motor cycle, with a bore and stroke of 45 by 90 mm., may be seen on the stand of the Victoria Trading Co. The engine has a spray carburettor, automatic gravity feed lubrication, and Ruthardt magneto. A lady's model will be exhibited; also a complete set for fitting to a pedal bicycle.

1909 Vindec Models.

The 1909 addition to the Vindec models is the F7, with 7 h.p. twin Vindec-Peugeot engine, 80 by 98, 6 in. adjustable pulley, 20 in. frame, and Truffault suspension. The $3\frac{1}{2}$ and 5 h.p. Vindec models are retained. All machines have handle-bar control, B. and B. carburettor, and Davison's petrol gauges to the tanks. Brooks's padded top saddles to Models H and F. All inlet valves have special adjustable screw caps and lock-nuts, so that any amount of valve opening may be used and wear taken up by adjustment.

The $3\frac{1}{2}$ h.p. Zenith fitted with Gradua gear controlled by the hand wheel shown beside the tank.

1909 Improvements.—

The latest introduction of Zenith Motors, Ltd., was described in *The Motor Cycle* of October 28th. This is the Zenith motor bicycle with rigid frame and Gradua gear. Other models exhibited will be two $3\frac{1}{2}$ h.p. Zenettes with spring frames and Gradua gears, a Zenette bicar, and a skeleton frame of the Zenette, showing the action of the springs. The gear will also be shown working, driven by an electric motor. The gear has been improved by the addition of a ratchet arrangement, which totally prevents the gear from being altered by vibration. Magneto ignition and handle-bar control will be fitted as a standard to all machines, and petrol and oil gauges will be fitted to all models. The Stanley Show will be the first occasion on which the Gradua gear will be exhibited to the public.

PASSENGER MACHINES.

The latest Millford novelty is a spring wheel sidecar of new and interesting design. The wheel is fitted to run on the ordinary type of ball bearings, but the spindle is supported at each end by universal attachments, that are in turn held in their normal position by two strong compression springs. These springs allow the wheel to have free vertical play and cause it to remain perpendicular, no matter how unequal the road surfaces may be. Thus road shocks are entirely absorbed by the springs, and side-slip reduced to a minimum. We are informed this invention was designed in their own works, and is fully protected. Other models will, of course, include the patented Castor wheel sidecar, which has proved a favourite with motor cyclists during the past three years.

Among the passenger attachments on exhibition of interest to motor cyclists will be the Bramson self-propelled rear car for either one or two passengers. This takes the form of a trailer, but instead of the motor bicycle being balanced and steered in the ordinary way when a trailer is attached with a flexible coupling, the Bramson self-propelled rear car attachment becomes one piece with the bicycle, and the combination stands upright both when in motion and when standing still. It is said that the riding and steering of the machine is exactly the same as a tricycle.

The well-tried Montgomery flexible sidecar will be shown on Stand 73 in the Main Hall. In addition two new models will make their first appearance under the name of Regent sidecars. One is a trailing wheel and the other a spring wheel rigidly attached sidecar.

That interesting little four-wheeled runabout the O.T.A.V. will be on exhibition at the Stanley Show. No alterations or improvements have been made in the design since it was last described in our pages, but those motor cyclists who contemplate the purchase of a machine of this class should not fail to examine it, particularly as the method of transmission and general details of the machine so closely follow motor cycle lines.

SOME OF THE ACCESSORY EXHIBITS.

An improved triple band brake, Eclair push-on inflator connections, and a new accumulator in which the positive plates can be renewed when the accumulator is exhausted will form the principal portion of Mr. H. J. Harding's exhibit. The push-on inflator connections are not so well appreciated by motor

cyclists as they ought to be, as they will fit any type of valve, and save the trouble of carrying different connections when air tubes with more than one type of valve are in use.

Peugeot single-cylinder and twin-cylinder engines will, as usual, be exhibited by the sole agent, Mr. J. Taylor. The 5 h.p. twin-cylinder model will be retained as a standard pattern for 1909, fitted with either a Longuemare or Amac carburetter. There are some improvements in detail which will be referred to in our report of the exhibition.

Among the interesting articles to be shown by the East London Rubber Co. may be mentioned a new automatic air inlet valve and the adjustable pulley which was recently illustrated in these pages.

A very large number of motor cycles will be fitted with Amac carburetters, and in addition the Aston Motor Accessories Co., Ltd., will, of course, exhibit them separately on their own stand. The I.C. type is the standard pattern, but on all Rex machines the I.D. pattern will be found. This only differs in regard to the levers on the handle-bar. The internal arrangement on both types is the same as described by "Ixion" a few weeks ago under the heading of "The Ideal Carburetter."

A multitudinous array of interesting accessories, such as springs, hardened and tempered folding spanners, screwdrivers, and a new automatic lock nut, will be found on the stand of Messrs. Herbert Terry and Sons.

Every show visitor should make it his business to call and see the Cowey speed indicator working at the stand of the Cowey Eng. Co., Ltd. This indicator has been specially made to stand the wear and vibration of motor cycles and give perfectly steady readings.

The ingenious Gripple joints, described in our recent article on "Motor Cycle Accessories," as well as numerous other accessories, will be found on the stand of the Merkhams Trading Co., Ltd.

J. B. Brooks and Co., Ltd., will, as usual, display all their well-known specialities, principal among which are their anti-vibratory saddles and seats, touring equipments, belts, bags, and a new patent adjustable locking spanner, which is guaranteed not to injure the edges of nuts.

A new model Sarolea engine is to be shown this year by the Tormo Mfg. Co. in addition to single and twin-cylinder air-cooled engines of the same name. The new engine is a V-type twin, water cooled, particularly suitable for passenger motor cycles.

Price's Patent Candle Co.'s exhibit of motor lubricants promises this year to be a regular centre of interest. During the past season their Motormine A motor cycle lubricant has scored a success in practically every event of importance in the motor cycle world.

Sarolea twin-cylinder water-cooled engine, with automatic inlet valves and gear-driven magneto.

1909 Improvements.—

In addition to engine lubricants, they will be showing hub, chain, and bearing lubricants.

Templeton Bros. will have a full range of Tee Bee specialities, including variable gears, stands, spring forks, and a Tee Bee motor cycle.

Electary accessories, which we recently dealt with in our special accessory article, can be examined on the stand of W. and R. Jacobs.

Sundry improvements have been introduced into the various fitments made by E. M. Bowden's Patent Syndicate, Ltd. Hundreds of motor cyclists possess machines which are not fitted with a handle-bar controlled carburetter, and, bearing this in mind, the Bowden's Syndicate has introduced a complete system of handle-bar control which can be attached to almost any existing carburetter and operated by the new pattern duplex handle-bar levers.

Bowden wire control from handle-bar, for attaching to existing carburetters.

J.A.P. engines will be found, fitted to several well-known makes of machines. There are three new models for 1909, two with mechanically operated valves on the side of the cylinder instead of overhead valves. They are an 8 h.p. twin-cylinder 85 by 85 mm. and a 4 h.p. single-cylinder 85 by 85 mm. The original 2½ h.p. lightweight engine has been entirely redesigned. The bore and stroke are 70 by 76 mm., and the automatic inlet valve is retained. The spindles, which were previously fitted to the flywheels by means of bosses and screws, will be fastened with cone, key, and nut in accordance with usual J.A.P. practice. The timing gear has been altered and entirely encased.

The Hella lamps, of which Messrs. Steiner and Co. claim to be the originators, will be exhibited by the above named firm, whilst the Continental Motor Co. will make a special display of the R.O.M. synchronised contact breakers and a new tyre with non-skidding tread, which is a combination of square rubber bars and steel studs, the rubber bar standing ⅙ in. above the tread and the steel stud ⅓ in. below it. Also a rubber cover with tread consisting of staggered rubber squares.

A motor cycle with a change speed gear fitted will be the exhibit of H. C. Griffin, whose gear is called the Griffin-Simplex combined variable pulley and two-speed gear. This gear is said to be readily applicable to any motor bicycle or tricar, belt or chain driven, without structural alterations, and will give any gear from 3½ to 6 to 1 on the top gear, with a thirty to fifty per cent. reduction for the low gear.

Aluminium castings of every description and samples of repairs to aluminium castings will be shown by R. W. Coan. Also Coan's patent aluminium steering

wheel for tricars with hollow rim and spokes, which can be heated by circulating hot water from the radiators through the wheel and back to the tank by a return pipe.

In addition to the above mentioned, there will be numerous exhibits of accessories. Reference to our plan guide to the show will enable readers to find any of these exhibits, as the stands are all numbered on the plan, and underneath each plan is a lettered inscription with the name of the firm corresponding to the stand number.

TYRES.

The majority of the well-known tyre companies will exhibit motor cycle tyres in all patterns. Improvements in tyres are always being made, but with few exceptions these detail improvements are confined to the manufacturing processes which tend toward ameliorating the conditions under which motor cycle are used. This has been particularly noticeable since the last Stanley Show, as the early part of 1908 saw the introduction of rubber studded covers which have proved so popular.

Motor cycle covers, both wired on and beaded edge in three different weights, also air tubes, will be shown by W. and A. Bates, Ltd.

Steel studded covers with the studs embedded in the rubber similar to the method used in the manufacture of motor car tyres will be a feature of the Continental Tyre and Rubber Co.'s exhibit, in addition to their standard and Modèle de Course patterns.

A new type of lock joint detachable tube will make its bow to the public at the Stanley Show. It is made by the Stuart Lock-joint Tube Co. The joint is really a butted one, but the ends of the air tube overlap considerably, so that there is less possibility of a burst taking place. Our illustration makes it fairly clear how this lock joint is made, and it will easily be seen that the harder the air tube is inflated the firmer the joint is held. When deflated it is an easy matter to change a punctured tube on the road. For motor cycles three qualities are made.

The lock joint of the new Stuart Detachable Air Tube.

The latest motor cycle tyres made by David Moseley and Sons have a special toughened rubber tread in addition to an extra ply of canvas. The non-skidding tread is made up of moulded arrow head shaped excrescences, with two ridges one each side passing right round the circumference.

The Michelin Tyre Co., Ltd., will include the following among their exhibits: Butt-ended and ordinary tubes, wired on and beaded motor cycle covers, valves, valve parts, and repair outfits.

In addition to the self-sealing air tubes for motor cycle tyres, the Self-sealing Rubber Co., Ltd., will exhibit patent detachable jointed air tubes with open and closed ends, tyre repair outfits, bands, non-slipping treads, etc.

Another firm exhibiting rubber studded non-skid treads is the Leicester Rubber Co., who have named their specialities John Bull. In addition to rubber studded covers, butt-ended and ordinary air tubes will be on view.

1909 Improvements.—

A brave display of cups, trophies, medals, and other prizes secured by users of Palmer motor cycle tyres will be a feature of the stand of the Palmer Tyre, Ltd. Two types of Palmer tyres are made, one with an extra strong fabric and the other with the airless cord fabric.

The Hanover Rubber Co. will show the Shamrock Excelsior tyres, and the Shamrock Gloria rubber and canvas belts. The latter have now been supplemented by a $1\frac{1}{8}$ in. size, specially designed for passenger motor cycles and high powered bicycles.

The North British Rubber Co. will exhibit the new Clincher rubber studded tyres in addition to their A1, Dreadnought, and ordinary pattern treads. The Dreadnought is also being made as a rubber studded non-skid, but instead of the studs being separated and

staggered at intervals over the cover, they are in three parallel lines joined together with rubber ridges of the same height as the studs.

The steel-studded non-skid cover will be fully represented by the Peter Union Tyre Co., Ltd., as well as motor cycle tyres of the plain rubber tread and basket pattern types; also puncture proof bands.

The Auto Cycle Union will have an office in the Gilbey Hall as last year. Motor cyclists who contemplate membership should certainly call and interview Mr. F. Straight, or one of the officials who will be in daily attendance. Members can have letters addressed to them c/o the A.C.U., Stand No. 281.

Readers who take an interest in camping should make a point of visiting the stand of the Association of Cycle Campers, where every requisite for light and portable camping will be shown, such as loaded motor cycles.

A NOVEL PASSENGER MACHINE.

PARTICULARS of a machine somewhat on the lines of the old rotary tricycle have reached us from Walker and Co., Lutterworth, this type of vehicle being one which a number of experienced motorists consider has possibilities for the future. The advantages of the type are its sociability, small number of working parts, and simplicity. Having but three wheels, it can be registered as a motor cycle, and the extra licensing fees for a car avoided. To all intents and purposes, it is a motor bicycle with rigid

fitted to the engine shaft, which combines free engine and change-speed gear, a jockey pulley taking up the slack on the low gears. The variable pulley can be regulated to give a $3\frac{1}{2}$ to 1 gear for level road work, and on reaching a hill it will automatically lower the gear according to the steepness of the hill. The present arrangement for starting the engine is to back the machine on to a leg which supports the rear wheel from the ground, a starting handle is fixed to the back axle, and the engine can be rotated at a

Two views of an experimental three-wheeled passenger machine which is an evolution of the detachable rigid sidecar and motor bicycle. It is described in the accompanying article.

sidecar attachment, but the outside wheel is placed further forward than in the case of the sidecar, and the driver's and passenger's seats are combined. For steering, the front and side wheels are coupled together similar to a car, and we are told the handling is very similar. If the steering wheel is released, the machine will run on in a direct line.

The runabout shown is driven by a 6 h.p. twin-cylinder air-cooled engine fitted with magneto ignition, and we are assured that no overheating has been experienced, no doubt owing to the exposed position of the engine. The drive is similar to a motor bicycle, by Whittle rim belt, and an expanding pulley is

good speed when the valve-lifter is raised. After the engine is started, the pulley is made free, the machine pushed off the leg, and the pulley flanges contracted by means of a pedal, so picking up the drive. The control levers are on the steering wheel. The back tyre is a 3 in. light car tyre, the other two 2 in. motor cycle tyres.

We understand that the "rotary" illustrated has been tested for about 5,000 miles, and the total cost of running has been less than $\frac{1}{2}$ d. a mile. The machine and pulley are protected and the design registered. The machine illustrated is the first one made, which accounts for its somewhat odd appearance.

SPECIAL FEATURES

1909 Improvements (Illustrated).

The Olympia Motor Exhibition.

TIME TO LIGHT LAMPS.—Nov. 18th, 5.7 p.m.; Nov. 21st, 5.3 p.m.; Nov. 25th, 4.59 p.m.

Next Week's Issue.

Next week's issue will contain a fully illustrated description of the motor cycles and accessories exhibited at the Stanley Show.

The Next Paper before the A.C.U.

It has been suggested that a paper should be read before the A.C.U. members next month on "Some Lessons of the Motor Cycle Tourist Trophy Race."

Children and the Rules of the Road.

Steps are being taken by the Motor Union to induce education authorities to give children some instruction in the rules and courtesies of the road.

Clubs Associated with the R.A.C.

The number of car clubs directly associated with the Royal Automobile Club is 21, and the number of motor cycle clubs associated through the Auto Cycle Union 36.

Growth of the M.U.

On October 31st the total number of individual members of the Motor Union stood at 6,075, as against 4,568 on the same date last year, an increase of 1,507. Including the affiliated clubs, the Union has a total membership of over 15,000.

Martin's Mile Record.

It has been pointed out to us that Harry Martin did not accomplish a mile a minute speed at the speed trials in Phoenix Park, Dublin, in 1903, as stated a fortnight ago, but Martin says that he did so at Castlewella in the Gordon-Bennett speed trials of the same year. His time for a mile with flying start was 59 $\frac{3}{4}$ s.

German Volunteer Motor Cyclists.

As the outcome of negotiations between the German War Office and the German Motor Cyclists' Association the latter has expressed its willingness to form a volunteer motor cycling corps. In connection with this corps the Association will organise a number of courier runs for training purposes, to be held under the supervision and with the co-operation of the military authorities.

Motor Cycles Badly Wanted.

Here are a few of the articles offered by various advertisers in *The Motor Cycle* last week in exchange for motor cycles: A talking cockatoo, gun, gold watch, diamond ring, drawing and bedroom suite, piano, furniture, lathe, gramophone, dynamo, musical box, violin, lantern, brazing forge, fretwork machine, pedal bicycles, a tandem, and a motor car. An idea of the esteem in which a motor cycle is held can be gathered from the above exchange offers.

New Tyres at the Stanley.

A number of new tyres will make their first appearance at the Stanley Show, in most cases the designers being experienced motor cyclists.

The Stanley Show.

Sir Albert K. Rollit will open the thirty-second annual Stanley Show at the Agricultural Hall, Islington, N., on Friday, the 20th inst. The exhibition is open daily from 11 a.m. to 10 p.m., and finally closes on Saturday, the 28th inst. Admission 1s.

New Model Motor Cycles.

A number of entirely new models are to make their *début* at the exhibition, including—

Humber two-speed and single geared machines.

Premier 3 $\frac{1}{2}$ h.p. single-cylinder machine.

James machine with detachable wheels.

L.M.C. lightweight with two-stroke twin-cylinder engine.

F.N. two-speed shaft-driven lightweight.

Victoria Trading Co.'s two-stroke ladies' and gentlemen's machines.

Alldays new model motor cycle.

Corah new model motor cycles.

Chater-Lea two-speed chain-driven twin-cylinder machine.

Bat combined motor bicycle and sidecar.

Vindec 7.9 h.p. twin-cylinder machine.

N.S.U. single-cylinder machine with change-speed gear in back hub, and a twin-cylinder lightweight with M.O.I.V. and geared down engine pulley.

Brooklands Meetings in 1909.

Though the full programme for next year's racing at Brooklands has not yet been settled, it has been decided to repeat the three popular two day meetings on the Easter, Whitsun, and August Bank Holidays, and the Saturdays which precede them.

A new pattern Dunlop non-skidding cover, which will be found fitted to several motor cycles at the Stanley Show. The Dunlop Tyre Co. (Ltd.) itself is not exhibiting at the Agricultural Hall.

Expenditure on Highways.

By the courtesy of the Roads Improvement Association, we are in a position to publish the following interesting figures relating to Expenditure on Highways in Great Britain and Ireland for the year 1905-6. Total mileage of roads 228,458, expenditure £18,464,379, number of highway authorities 2,491. The total mileage of roads does not include roads in Ireland, as there are no figures available as to length of roads maintained by county and urban districts.

A Well-merited Conviction.

For throwing a bottle full of beer at the occupants of a passing motor car Richard Wake, a pensioner of Watersfield, has been sentenced at the Peterworth Police Court to six weeks' hard labour. The prosecution was undertaken at the instance of the Automobile Association.

"The Autocar" Lectures.

Only four lectures now remain to be given in each of the provincial centres viz., Birmingham, Leeds, Manchester and Newcastle-on-Tyne. Readers who desire to be acquainted with the mechanism of a car and its working should apply for a ticket (price 10s. 6d.) to the Lecture Secretary, 20, Tudor Street, E.C. The next lecture, the fifth of the series, will be on "Carburation, Cooling, and Lubrication."

New Motor Cycle Company.

Motor cyclists will be interested to know that in future the well-known Vindec motor cycles will be handled by a new company, the management of which will be in the capable hands of Mr. W. H. Wells. Mr. Wells has been manager of the motor cycle department of the South British Trading Co. for six years, and the demand for Vindec motor cycles having exceeded the supply, Mr. Wells has decided to found a company specially to look after the interests of Vindec Special machines.

The Roads Improvement Association.

The Roads Improvement Association, 1, Albemarle Street, Piccadilly, W., has received from the Royal Automobile Club a cheque for £75 as the Club's contribution to the funds of the Association for 1908. The thanks of the Association have been conveyed to the Club for its support. Membership of the Association is open to all persons or organisations interested in securing good roads. Individual subscription is 5s. per annum, or £1 1s. for five years. Provincial automobile clubs, the C.T.C. and N.C.U., are among the supporters of the Association.

The Olympia Motor Exhibition.

THOUGH essentially a show for those interested in the larger type of motor vehicles, no motor cyclist should fail to visit Olympia. Important firms, dealing in accessories and clothing, such as Gamage, Dunhill, Markt, U.M.I., the Bosch Magneto Co., Peto and Bedford, Simms Mfg. Co., etc., have stands here, on which many items may be seen which will appeal to our readers. While nearly all the firms just mentioned will not be represented at the coming Stanley Show. The latter must be regarded as an exhibition of complete motor bicycles, while the former one is especially important as regards accessories, clothing, electrical fittings, and tyres. The new motor cycle tyres shown by Kempshalls, the Sirdar Rubber Co., and the von Rubber Co. are well worthy of inspection.

ANGLO-AMERICAN OIL Co., LTD. (Stand 180).—The Anglo-American Oil Co. handle the almost universally used Pratt's motor spirit. The ordinary petrol is now known as Pratt's perfection spirit and the heavy type as Pratt's Taxibus spirit.

AUTOLOC SYNDICATE, LTD. (Stand 203).—It is interesting to note that the Aster Engineering Co., of Wembley, have taken over the business connected with the Autoloc Syndicate. Our readers will remember that Autoloc levers cannot have their position altered through vibration, although noatchet is provided. An especially neat clip is to be seen on this stand, carrying two levers, presumably for the throttle and air control. This is known as the "double handle-bar control," and is a specially neat method.

THE AVON INDIARUBBER Co., LTD. (Stand 285).—This firm is showing ribbed motor cycle tyres. The ribs are of good depth, and should be of assistance against skidding. As regards quality, these tyres have a good reputation.

BENEFINK AND Co., LLD. (Stand 182).—A fuse for use with non-trembler coil, designed so that if the driver forgets to switch off, the fuse prevents damage to the accumulator. A spare length of wire is supplied, so that a new fuse wire can be inserted in a few seconds. The Bullard speedometer is also shown.

THE BOSCH MAGNETO Co., LTD. (Stand 300).—A most interesting display of Bosch magnetos is to be found on this stand. No less than six different types are shown. The working of the magneto is so well known that we need not go into it in detail, but it is interesting to note that all models are now fitted with the new contact-breaker, using steel cams for breaking the circuit, instead of the fibre ring. A new model shown on this stand is a magneto for cylinders of 90°, which, however, is more suitable for engines of large horse-power. Two large photographs to be seen on the stand show the enterprise of the Bosch Co. in fitting up machines not specially designed for magneto ignition. These two photographs represent Minerva motor bicycles of 4 h.p., on the engines of which Bosch magnetos have been neatly and effectively fitted. Other points of interest which probably many of our readers have not seen previously are boxes containing spare parts for all motor cycle devices, containing spare contact-breaker, insulator ring, brush, etc.

BRANSOM, KENT, AND Co., LTD. (Stand 202).—Some interesting motor cycle lamps. A new pattern, oval in shape, and with a hood projecting vertically over the front, is worthy of attention. The hood referred to projects the light on to the number plate. A lens mirror lamp, and one self-contained, which should be highly suitable for light motor cycles.

BRITISH PETROLEUM Co. (Stand 232).—The well-known vendors of Shell motor spirit are showing all types of motor spirit. They exhibit as well samples of lubricants.

BROWN AND BARLOW (Stand 218).—The latest form of handle-bar controlled carburetter for motor cycles, a good example of which is shown in section, thus clearly demonstrating how it works. This carburetter has been recently described in our pages.

THE COWEY ENGINEERING Co. (Stand 188).—The Cowey speedometer is shown fitted to a motor bicycle wheel. By turning this wheel the behaviour of the device may be seen under working conditions. We understand that this instrument has met with great favour during the year. It is gear-driven through a flexible shaft, and the dial is carried on the handle-bar.

ALFRED DUNHILL, LTD. (Stand 197).—Motor cycle clothing and waterproof overalls; a good lens mirror headlight, a motor cycle oil lamp, and an acetylene lamp with a separate generator.

HARVEY FROST AND Co. (Stand 209).—The chief item of interest on this stand which will appeal to motor cyclists is the Baby vulcaniser, an exceedingly handy little device for doing all kinds of repairs to motor cycle tyres.

FULLER AND SON (Stand 289).—A new trembler coil made in the well-known Midget size, which takes up a very small amount of room in the tank. The trembler is arranged on different lines, and an extra screw is provided for altering the tension of the blade, by means of which a certain amount of economy is effected. Messrs. Fuller and Son also make a motor cycle magneto, but it is not shown. Fuller's accumulators are also exhibited, while their charging batteries are useful to many who have not access to a charging plant. The Fuller electric headlight is very small, but as it contains an Osram bulb it gives a good light. It is provided with a condenser lens.

The Jones handle-bar speedometer shown at Olympia by Markt & Co. The gear drive from the front wheel is shown in the left-hand illustration.

A. W. GAMAGE, LTD. (Stand 199).—No stand at Olympia will offer greater attractions to motor cyclists than that of A. W. Gamage, whose range of motor accessories is extremely extensive. Almost every type of motor tool is well displayed, but among those we were shown was a small hammer, the head of which consists of copper tube filled with lead, which is, of course, meant to hit articles which would be damaged by an ordinary steel hammer. The minute Osmond wrench is shown enclosed in a Russia leather case, so that it can be carried in the pocket without damaging the former. A useful tool to be seen on this stand is a pair of combination pliers, provided with specially hardened steel cutters. These blades, when blunt or worn, can be easily replaced, as they are carried in grooves. Another item of great interest to motor cyclists is the Bullard speedometer, a well-made speed indicating instrument which registers up to fifty miles an hour. As regards clothing, Messrs. A. W. Gamage have taken great pains to cater for motor cyclists. Waterproof suits are supplied—with trousers—which amply protect the body and legs. Another suit has the leg coverings separate, and the waterproof material wraps completely round the calves and is then fastened with a strap.

GROSE, LTD. (Stand 265).—One of the first steel-studded non-skids to be commercially successful was the Grose. In actual practice we have found these bands to be most satisfactory, both as regards wearing qualities and as non-skids. A new model for this year is a band provided with a cushion between that portion to which the studs are attached and the tyre itself, so that no unfair strain is put upon the latter.

E. J. HARDY (Stand 243).—The Instanta belt fastener, for use with adjustable pulleys, consists of two portions attached

The Olympia Motor Exhibition.—

to the belt, each provided with a socket for a steel coupling with balls at either end like a dumb-bell. On the latest pattern Longuemare carburetter the air inlet, instead of working horizontally, now works vertically.

HEDLEY, HUNT, AND Co., LTD. (Stand 193).—The Rat ratchet spanner, a useful tool with ratchet attachment to fit two sizes of nuts; Beltine, a dressing for leather belts; and sundry tools.

THE KEMPSTALL TYRE Co. (EUROPE), LTD. (Stand 272).—A new 26in. by 2½in. motor cycle cover is shown here for the first time. The Kempshall tyre has a square tread with circular indentations, containing large round rubber studs, placed at intervals, while ribs run vertically towards the rim, also at equal intervals, which serve to strengthen the walls of the tyre. The covers contain a large amount of rubber, and on account of the studs possess valuable non-skidding qualities. The insulating qualities of the tyre should be excellent, as, owing to the strength of the walls, it need only be pumped up to a very low pressure.

LAKE AND ELLIOT (Stand 247).—Many useful motor cycle tools and accessories.

LAYSTALL MOTOR ENGINEERING Co., LTD. (Stand 171).—Some very interesting examples of this firm's excellent work are to be seen here. Motor cyclists who want repairs will do well to inspect this firm's exhibit. They also make a speciality of making nickel steel exhaust valves, pistons, and cutting gears.

MARKT AND Co. (Stand 211).—The new Jones speedometer for motor cycles (see previous page) registers from zero to fifty miles an hour, and is sold at a moderate figure. For a slightly extra fee, it can be supplied fitted with a mileage recorder. We were also shown a handsome four-twist horn, which gives a very deep and melodious note.

MOEBIUS AND SON (Stand 212) are showing samples of their well known oils and greases. The same firm also make a point of selling calcium carbide.

PEARSON'S (Stand 210).—This firm is showing motor cycle accumulators and coils, and also a new form of magneto, which has not yet come before the motor cycling public. This is the Hirst. It is small in size, neatly constructed, and gives an excellent spark at slow speeds.

PETO AND RADFORD, LTD. (Stand 234).—One of the chief novelties on this stand is a new plug which is very substantially constructed. The central core consists of nickel steel, and is of ample dimensions. The insulating portion is porcelain, and these plugs may be seen being assembled on the stand. A point is also made of a good non-trembler coil for motor bicycles provided with an ample condenser, so that the platinum points are not quickly burned.

PRESTED MINERS' GAS INDICATING ELECTRIC LAMP Co. (Stand 167).—Messrs. Prested's well-known coils and accumulators are to be seen on this stand.

PRICE'S PATENT CANDLE Co. (Stand 237).—On this stand are to be seen samples of this company's well known lubricants. It will be remembered that Price's oil was used with great success in nearly all the important motor cycle competitions held last year, and was used by the winner in the Tourist Trophy. The judges' report of the End-to-end Trial may be had on application to the company.

R. AND J. PULLMAN (Stand 252).—Leather steel-studded non-skid bands, which have recently found great favour with users of motor bicycles.

G. T. RICHES AND Co. (Stand 238).—Here is to be seen the latest pattern Clair silencer for motor cycles, which consists of a series of perforated cups fitting one inside the other. It effectively silences the most noisy machine. Another interesting little accessory is the Maxfield snap terminal. By means of a spring it is quickly attached to the plug, while it also comprises a shorting device, so that either of the two cylinders of a twin can be cut out so that the other may be tested. Another neat accessory is the Orno handy blow lamp, most suitable for doing small repairs on the road, and is sold at a very moderate figure. A speciality is also made, as most of our readers are aware, of the Rich detachable air tube.

ROSS, COURTNEY, AND Co., LTD. (Stand 192).—Motor cycle oil pumps, the well-known Ross and Courtney electrical

terminals, and various examples of small brass work, such as compression taps, accumulators, screw terminals, etc.

SIEMENS BROS. AND Co., LTD. (Stand 174).—The Obach dry cell, which we understand is giving great satisfaction at the present time. Two batteries are recommended to be carried, so that one can switch over from one to the other occasionally, so giving the one that has been working a rest. With dry batteries Messrs. Siemens recommend a special economical coil suitable for this purpose which they exhibit. Other specialities are high and low tension cables, which are very strongly constructed.

THE SIMMS MANUFACTURING Co., LTD. (Stand 294). A new British-made motor cycle magneto is shown on this stand.

One of the chief points about it is its extreme lightness, weighing, as it does, only 5½ lbs., yet it gives a very hot spark, and is capable of firing machines up to 4 h.p. A magneto of the same size can also be purchased for V twin - cylinder machines. This magneto is beautifully made, and exceedingly well finished, and is the only magneto of its size provided with ball bearings. The contact breaker has been made slightly different in detail from previous models, and the condenser is carried

The new pattern Simms British-made magneto for motor cycles.

at the end of the armature. The Simms Mfg. Co. have also introduced a new motor cycle plug, specially designed, of course, for magneto work. The insulation is Steatite, and the plug is substantially made throughout. It is made as short as possible so as to give ample clearance in the case of the tank coming low down.

THE SIRDAR RUBBER Co. (Stand 254).—This company are making a speciality of motor cycle covers. Samples which were shown to us at Olympia created a most favourable impression. Provided with an ample tread and strong walls, they appeared to be really suitable for hard work. Three types are made—those with ribbed treads, a heavier type with transverse grooves, and a steel-studded cover. Of the latter two tyres are shown which have covered 2,000 miles, and have been returned for retreading; their condition is excellent, and not a stud is missing.

THE UNITED MOTOR INDUSTRIES (Stand 196) is always one which is well worthy of a visit. One of the items which is especially of interest to our readers is the "Three Spires" tyre, which has been lately described in our pages. It is a Coventry production, and Mr. G. E. Roberts, the Midland representative of the U.M.I., speaks well of its behaviour after having put it to very severe tests. Other items of interest are the Bousfield silencer and the Frank lamp and generator, the Leicester switch, and a mirror. The L.M. plug has now been re-designed. It is strongly constructed and non-sooting, and is specially adapted for use with a magneto.

C. A. VANDERVELL AND Co. (Stand 250).—For the first time Ruthardt motor cycle magnetos are shown to the public. These models are chiefly famous for their light weight. Messrs. Vandervell and Co. have always been famous for their coils, and it is interesting to remind our readers that C. R. Collier's record was accomplished on a machine fitted with these accessories. The non-trembler coil is one which is guaranteed to 1,000 miles without pitting of the platinum points. It is made in two shapes, square or round. The new C.A.V. plug is guaranteed for two years. The insulation consists of treble baked porcelain, dark blue in colour. The electrodes are substantially made of nickel.

Phoenix Motors, Ltd., Blundell Street, Caledonian Road, King's Cross N., are not exhibiting at the Stanley Show, but will have models of their Trimco on exhibition in their showrooms at the above address, which is easily reached from the Agricultural Hall.

North Islington Conservative and Unionist M.C.

The result of the above named club's hill-climb at Red-bourn is as follows: 1, Mr. H. Compton, 6 h.p. Chater-Lea Carrette; 2, Mr. W. Price, 5 h.p. twin Peugeot; 3, Mr. T. Campbell, $3\frac{1}{2}$ h.p. 1908 Triumph.

Richmond and District M.C.C.

Members are reminded that the annual dinner of the above club will be held at the Trocadero Restaurant at 7.30 p.m. on November 20th. Dr. W. M. Paul, vice-president, has kindly consented to take the chair on this occasion. Members will meet at the Motor Show at Olympia at 4 o'clock, when a visit of inspection will be made of the exhibits.

Motor Cycling Club.
